# Structural diversification of the aminobicyclo[4.3.0]nonane skeleton using alkynylsilyl-derived allylic trichloroacetimidates $\dagger$ 

Mohamed A. B. Mostafa, Angus E. McMillan and Andrew Sutherland*

#### Abstract

The amino substituted bicyclo[4.3.0]nonane is a molecular scaffold found in a wide range of natural products and medicinal agents. Despite this, synthetic methods for the general preparation of this structural motif are sparse. Here we evaluate a diastereoselective approach for the preparation of vinylsilyl derived aminobicyclo[4.3.0]nonanes using a one-pot multi-bond forming process involving a Pd(॥)-catalysed Overman rearrangement, a Ru(I)-catalysed ring closing enyne metathesis reaction, followed by a hydrogen bonding directed Diels-Alder reaction. We show that a benzyldimethylsilyl-substituted alkene analogue is amenable to further functionalisation and the late stage generation of diverse $\mathrm{sp}^{3}$-rich, drug-like aminobicyclo[4.3.0]nonane scaffolds with up to six stereogenic centres.

## Introduction

The amino substituted bicyclo[4.3.0]nonane core is found in various natural products, ${ }^{1}$ such as guanidine alkaloid netamine A (1), ${ }^{2}$ the antitumour antibiotics (+)-ptilocaulin (2) ${ }^{3}$ and kinamycin A (3), ${ }^{4}$ as well as the lycopodium alkaloid serratinine (4) (Fig. 1). ${ }^{5}$ Amino-indanes, a partially saturated form of

Fig. 1 Biologically active aminobicyclo[4.3.0]nonanes and aminoindanes.

[^0]the aminobicyclo[4.3.0]nonane scaffold are also found in a diverse range of pharmacologically important compounds including the monoamine transporter inhibitor ( + )-indatraline $(5)^{6}$ and, rasagiline (6) (Azilect), used for the treatment of Parkinson's disease. ${ }^{7}$ While there are synthetic methods for the preparation of specific aminobicyclo[4.3.0]nonanes, ${ }^{8}$ there are relatively few general strategies for the stereoselective synthesis of this scaffold that is modular, allowing late-stage structural diversification. ${ }^{9}$

With the aim of developing new strategies for the preparation of drug-like scaffolds, we reported a one-pot, three-step multi-bond forming process of alkyne derived allylic alcohols that utilised an Overman rearrangement, a ring closing enyne metathesis (RCEYM) step and a Diels-Alder reaction for the general preparation of aminobicyclo[4.3.0]nonanes. ${ }^{10}$ More recently the diversity of this library was extended by using C-7 substituted hept-2-en-6-yn-1-ols (Scheme 1a). ${ }^{11}$ As well as yielding aminobicyclo[4.3.0]nonanes with additional functionality, the presence of a C-7 substituent within the allylic trichloroacetimidate substrate, allowed the use of mild palladium(II)catalysed conditions for the Overman rearrangement step. ${ }^{12}$ Although diversity could be introduced into the aminobicyclo [4.3.0]nonane core during the final-stage Diels-Alder reaction, the other point of diversity was via a Sonogashira reaction during the first step. This required substantial effort to generate a small library of these compounds with various R-groups. To overcome this limitation, we decided to investigate an alternative C-7 substituent that would be compatible with the synthesis of alkyne-derived allylic trichloroacetimidates, allow a $\operatorname{Pd}(\mathrm{II})$-catalysed Overman rearrangement and be used as a functional handle for late-stage diversification.

Scheme 1 One-pot methods for the synthesis of aminobicyclo[4.3.0]nonanes.

We now report the use of alkynylsilyl derived allylic trichloroacetimidates as substrates for the one-pot multi-bond forming process and the diastereoselective synthesis of aminobicyclo[4.3.0]nonanes bearing a vinylsilane functional handle (Scheme 1b). We also demonstrate the synthetic utility of a benzyldimethylsilyl (BDMS) analogue for the late-stage synthesis of a small library of novel, drug-like aminobicyclo[4.3.0] nonanes with up to six stereogenic centres.

## Results and discussion

The first aim of this project was the synthesis of a hept-2-en-6-yn-1-ol bearing a C-7 silyl group. Although a wide-range of silanes have been developed for cross-coupling reactions, ${ }^{13}$ the BDMS group ${ }^{14}$ was chosen as this was likely to be stable to the various steps required for allylic alcohol synthesis and the conditions of the one-pot process. While the vinyl-BDMS functionality is relatively robust, it has been used in a number of Hiyama-Denmark type couplings. ${ }^{15}$ To probe the steric requirements of the one-pot three-step process, the tertbutyldimethylsilyl (TBDMS) analogue was also prepared. Initially, pent-4-yn-1-ol bearing a C-5 TBDMS group was prepared in a one-pot operation by silylation of both the alkyne and alcohol moieties, followed by acid-mediated hydrolysis of the silyloxy group (Scheme 2). ${ }^{16}$ While this allowed rapid access to 5 -(tert-butyldimethylsilyl)pent-4-yn-1-ol (8), the overall yield was only $31 \%$. Therefore, preparation of the corresponding BDMS analogue $\mathbf{1 1}$ was performed in a stepwise fashion, with protection of the hydroxyl group as a THP ether before silylation of the alkyne with benzyldimethylsilyl chloride under basic conditions. ${ }^{17}$ Removal of the THP protecting group then gave 5 -(benzyldimethylsilyl)pent-4-yn-1-ol (11) in quantitative yield over the three steps. The pent-4-yn-1-ols 8 and 11 were converted to the $(E)-\alpha, \beta$-unsaturated ethyl esters 12 and 13 in high yields using a one-pot Swern oxidation and Horner-Wadsworth-Emmons reaction under mild Masamune-Roush condtions. ${ }^{18,19}$ Reduction of the ester

Scheme 2 Synthesis of alkynyl derived allylic alcohols 14 and 15.
groups using DIBAL-H then gave allylic alcohols 14 and 15 in excellent yields. The highly efficient six-step route ( $90 \%$ overall yield) for the preparation of BDMS-derived allylic alcohol 15 was easily amenable to scale-up, allowing synthesis of multigram quantities of this key substrate.

Having prepared the alkynylsilyl derived allylic alcohols, conditions for an optimal one-pot synthesis of the corresponding aminobicyclo[4.3.0]nonanes were next explored. The TBDMS-analogue that was designed to probe the steric limitation of the one-pot process was initially investigated (Scheme 3). The allylic trichloroacetimidate was formed by reaction of $\mathbf{1 4}$ with trichloroacetonitrile and DBU and without purification, ${ }^{20}$ this was subjected to the one-pot three-step

Scheme 3 Synthesis of aminobicyclo[4.3.0]nonanes 16 and 17.
process. In our previous study that evaluated C-7 substituted alkyne derived allylic alcohols for the one-pot process, it was found that while a relatively bulky substituent prevented coordination of the $\operatorname{Pd}(\mathrm{II})$-catalyst to the alkyne and facilitated an efficient Overman rearrangement, the presence of this group hindered the following RCEYM step. ${ }^{11 b}$ With the TBDMS-derived allylic trichloroacetimidate, a similar outcome was observed for both steps. The $\operatorname{Pd}(\mathrm{II})$-catalysed Overman rearrangement proceeded under standard conditions to give the allylic trichloroacetamide after 12 hours, ${ }^{21}$ however, the RCEYM reaction required forcing conditions. A combination of the use of 1,7 -octadiene (an in situ source of ethylene) to accelerate the reaction, ${ }^{22}$ high loading of Grubbs $2^{\text {nd }}$ generation catalyst ( $20 \mathrm{~mol} \%$ ) and a 120 hour reaction time was required for complete conversion to the enyne. ${ }^{23}$ Following the hydrogen bonding directed Diels-Alder reaction with $N$-phenyl maleimide, aminobicyclo[4.3.0]nonane 16 was isolated as a single diastereomer in $19 \%$ yield over the four steps. This rela-
tively low yield is likely due to the extended RCEYM step and demonstrates the steric limitation of the one-pot process.

Application of the one-pot process using BDMS-allylic alcohol 15 was more straightforward (Scheme 3). Again, allylic trichloroacetimidate formation and $\operatorname{Pd}(\mathrm{II})$-catalysed Overman rearrangement proceeded under standard conditions. The RCEYM reaction did require the presence of 1,7 -octadiene, but needed only $7 \mathrm{~mol} \%$ catalyst loading and was complete after 18 hours. Diels-Alder reaction with $N$-phenyl maleimide then gave aminobicyclo[4.3.0]nonane 17 as a single diastereomer in $57 \%$ yield over the four steps. As previously reported for the Diels-Alder reaction of trichloroacetamide derived cyclic exodienes, the reaction proceeds via a hydrogen bonding controlled endo transition state, forming the syn-products (syn relationship of hydrogen atoms at C-3a, C-8, C-8a and C-8b) with excellent diastereoselectivity $(>20: 1))^{10,11}$ Analysis of BDMS-derived aminobicyclo[4.3.0]nonane 17 using difference NOE experiments confirmed the relative stereochemistry and that the Diels-Alder reaction has proceeded in the same manner as other trichloroacetamide derived cyclic exo-diene substrates (Scheme 3). ${ }^{24}$

Having used the BDMS-group to perform a mild $\operatorname{Pd}(\mathrm{II})$-catalysed Overman rearrangement and efficiently access the aminobicyclo[4.3.0]nonane core, we next wanted to demonstrate that the resulting vinylsilane could be used for the late-stage synthesis of a wide range of derivatives. Initially, removal of the trialkylsilyl group to access the parent scaffold was investigated (Scheme 4). During introduction of the BDMS-group for cross-coupling reactions, Trost and co-workers showed that BDMS-vinylsilanes were stable to proto-desilylation under typical fluoride conditions. ${ }^{14}$ This was confirmed on treatment of vinylsilane 17 with TBAF, which showed no reaction. Increasing the temperature or duration of the reaction only led to decomposition. Cleavage of the $\mathrm{C}-\mathrm{Si}$ bond was achieved

Scheme 4 Synthesis and oxidation of aminobicyclo[4.3.0]nonane 18.
under acidic conditions. While the use of dilute hydrochloric acid solutions ( 2 M or 4 M ) gave only partial proto-desilylation, treatment of $\mathbf{1 7}$ with 6 M hydrochloric acid at $60^{\circ} \mathrm{C}$ gave $\mathbf{1 8}$ cleanly, in $74 \%$ yield. The reactivity of tri-substituted alkene 18 to oxidation was next studied. Osmium tetroxide mediated dihydroxylation under Donohoe conditions gave the desired diol product 19 as a single diastereomer in $86 \%$ yield. ${ }^{25}$ In a similar fashion, treatment of $\mathbf{1 8}$ with $m$-CPBA proceeded with high selectivity and the major diastereomer 20 was isolated in $73 \%$ yield. ${ }^{26,27}$ The high selectivity for both reactions is a consequence of the relative stereochemistry at the C-3a, C-8, C-8a and $\mathrm{C}-8 \mathrm{~b}$ positions of the tricyclic core of $\mathbf{1 8}$. This creates a curved shape to the molecule where reactions readily take place at the more exposed convex face.

The final stage of this project then investigated cross-coupling reactions of vinylsilane $\mathbf{1 7}$ for the late-stage diversification of the aminobicyclo[4.3.0]nonane core. Using standard conditions for Hiyama-Denmark reactions with the BDMSgroup, ${ }^{14}$ attempts were made to couple 17 with various elec-tron-rich and electron-deficient aryl iodides. However, these reactions showed only decomposition of vinylsilane 17 . Due to the inability of $\mathbf{1 7}$ to undergo cross-coupling reactions, an alternative strategy was sought using a more reactive vinyl functionality. Iodo-desilylation of vinylsilane 17 was found to proceed readily with iodine monochloride and gave vinyl iodide 21 in $88 \%$ yield (Scheme 5). ${ }^{28}$ This was then used to explore various palladium-catalysed cross-coupling reactions.

After some optimisation, vinyl iodide 21 was found to be an efficient cross-coupling partner for Suzuki-Miyaura reactions.

17

21 $\underset{\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}}{\mathrm{Ph}} \left\lvert\, \begin{gathered}\mathrm{Cul}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{DMF} \\ \mathrm{rt}, 2 \mathrm{~h}, 48 \%\end{gathered}\right.$

25

Scheme 5 Synthesis and cross-coupling reactions of vinyl iodide 21.

Using $\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(10 \mathrm{~mol} \%)$ and phenylboronic acid under typical conditions gave the cross-coupled product 22 in $76 \%$ yield. Reaction of an electron-rich variant, $p$-methoxyphenylboronic acid also proceed smoothly, giving 23 in $53 \%$ yield. In previous studies, we have found that the trichloroacetamide group is prone to dechlorination during $\operatorname{Pd}(0)$-catalysed reactions. ${ }^{11 b, 29}$ Similarly, in the Suzuki-Miyaura reactions to form 22 and 23, small amounts of dichloroacetamide analogues of these compounds were observed in the reaction mixture ( $<10 \%$ ). This became a more significant issue in attempting a cross-coupling reaction with electron-defficient $p$-fluorophenylboronic acid, where substantial amounts of the reduced coupled product were also detected ( $\sim 20 \%$ ). However, this byproduct could be minimised ( $<10 \%$ ) by using a shorter reaction time, which allowed the synthesis of 24 in $46 \%$ yield. To expand the diversity of aminobicyclo[4.3.0]nonanes at the C-5 position, a Sonogashira reaction with phenylacetylene was also performed. For this example, both palladium-mediated coupling and reduction of the trichloroacetamide were found to be rapid, leading to isolation of the dichloroacetamide-derived enyne 25 as the major product, in $48 \%$ yield.

## Conclusions

In conclusion, two alkynylsilyl derived allylic trichloroacetimidates have been prepared and evaluated as substrates for a one-pot multi-reaction process for the preparation of novel aminobicyclo[4.3.0]nonanes. While a TBDMS-derivative showed the steric limitations of this process, a BDMS-analogue was efficiently converted to the corresponding aminobicyclo [4.3.0]nonane in good overall yield. The BDMS-compound was then explored for the late-stage diversification of the aminobicyclo[4.3.0]nonane core. Vinylsilane 17 was found to undergo both proto-desilylation and iodo-silylation reactions, leading to derivatives that could undergo a range of oxidation and cross-coupling reactions. Overall, this study has developed a general route to novel, sp $^{3}$-rich aminobicyclo[4.3.0]nonanes incorporating diversity at a late-stage of the synthesis. To exemplify the strategy, the project focused on using a single dienophile, $N$-phenyl maleimide during the Diels-Alder reaction. However, as shown in previous studies, ${ }^{11}$ we believe that other alkenes will react readily with the BDMS-derived diene allowing further late-stage expansion of the compounds that can be formed via this process. Work is currently underway to achieve this goal and explore further reactions of BDMS-derived aminobicyclo[4.3.0]nonanes.

## Experimental

All reagents and starting materials were obtained from commercial sources and used as received. All dry solvents were purified using a PureSolv 500 MD solvent purification system. All reactions were performed under an atmosphere of argon unless otherwise mentioned. Brine refers to a saturated solu-
tion of sodium chloride. Flash column chromatography was performed using Fisher matrix silica 60. Macherey-Nagel alu-minium-backed plates pre-coated with silica gel 60 (UV254) were used for thin layer chromatography and were visualised by staining with $\mathrm{KMnO}_{4} \cdot{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Bruker DPX $400\left({ }^{1} \mathrm{H}: 400 \mathrm{MHz} ;{ }^{13} \mathrm{C}: 101 \mathrm{MHz}\right)$ spectrometer or a Bruker $500\left({ }^{1} \mathrm{H}: 500 \mathrm{MHz} ;{ }^{13} \mathrm{C}: 126 \mathrm{MHz}\right)$ spectrometer with chemical shift values reported in ppm relative to a residual solvent peak and in the solvent stated. Assignment of ${ }^{1} \mathrm{H}$ NMR signals is based on COSY experiments. Assignment of ${ }^{13} \mathrm{C}$ NMR signals is based on HSQC and/or DEPT experiments. All coupling constants, $J$, are quoted in Hz . Mass spectra were obtained using a JEOL JMS-700 spectrometer for EI and CI or a Bruker Microtof-q for ESI. Infrared spectra were obtained neat using a Shimadzu IRPrestige-21 spectrometer. Melting points were determined on a Reichert platform melting point apparatus.

## 5-(tert-Butyldimethylsilyl)pent-4-yn-1-ol (8) ${ }^{30}$

$n$-Butyllithium ( $0.520 \mathrm{~mL}, 1.31 \mathrm{mmol}, 2.5 \mathrm{M}$ in hexane) was added dropwise to a solution of 4-pentyn-1-ol (7) (0.050 g, $0.590 \mathrm{mmol})$ in tetrahydrofuran $(20 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$. The reaction mixture was stirred for 0.75 h at $-78{ }^{\circ} \mathrm{C}$. tertButyldimethylsilyl chloride ( $0.220 \mathrm{~g}, 1.48 \mathrm{mmol}$ ) was then added. The reaction mixture was allowed to warm to room temperature and stirred for 18 h . A 1 M aqueous solution of hydrochloric acid ( 2 mL ) was then added and the mixture was stirred for 2 h . The resulting mixture was diluted with ethyl acetate $(10 \mathrm{~mL})$, washed with water $(2 \times 15 \mathrm{~mL})$ and a saturated solution of sodium bicarbonate ( 15 mL ). The aqueous layers were washed with ethyl acetate ( $2 \times 15 \mathrm{~mL}$ ), and the combined organic phase was washed with brine ( 20 mL ), dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated in vacuo. Purification by flash column chromatography (petroleum ether/ethyl acetate, $9: 1$ ) gave 5-(tert-butyldimethylsilyl)pent-4-yn-1-ol (8) ( $0.036 \mathrm{~g}, 31 \%$ ) as a colourless oil. Spectroscopic data were consistent with the literature. ${ }^{30} \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 0.06\left(6 \mathrm{H}, \mathrm{s}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right), 0.90$ $\left(9 \mathrm{H}, \mathrm{s}, \mathrm{SiC}\left(\mathrm{CH}_{3}\right)_{3}\right), 1.75\left(2 \mathrm{H}\right.$, quin., $\left.J 6.5 \mathrm{~Hz}, 2-\mathrm{H}_{2}\right), 1.99(1 \mathrm{H}$, br $\mathrm{s}, \mathrm{OH}), 2.34\left(2 \mathrm{H}, \mathrm{t}, J 6.5 \mathrm{~Hz}, 3-\mathrm{H}_{2}\right), 3.74\left(2 \mathrm{H}, \mathrm{t}, J 6.5 \mathrm{~Hz}, 1-\mathrm{H}_{2}\right)$; $\delta_{\mathrm{C}}\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)-4.5\left(2 \times \mathrm{CH}_{3}\right), 16.5(\mathrm{C}), 16.5\left(\mathrm{CH}_{2}\right), 26.1$ $\left(3 \times \mathrm{CH}_{3}\right), 31.3\left(\mathrm{CH}_{2}\right), 61.8\left(\mathrm{CH}_{2}\right), 83.3(\mathrm{C}), 107.2(\mathrm{C}) ; \mathrm{m} / \mathrm{z}(\mathrm{ESI})$ 221 ( $\mathrm{MNa}^{+} .100 \%$ ).

## 1-(Tetrahydropyran-2'-yloxy)-4-pentyne (9) ${ }^{31}$

To a solution of 4-pentyn-1-ol (7) ( $0.900 \mathrm{~g}, 10.8 \mathrm{mmol}$ ) and a catalytic amount of $p$-toluenesulfonic acid monohydrate $(0.020 \mathrm{~g})$ in dichloromethane $(25 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added $3,4-$ dihydro- 2 H -pyran ( $2.71 \mathrm{~g}, 32.2 \mathrm{mmol}$ ). The reaction mixture was allowed to warm to room temperature and stirred for 2.5 h . Ethyl acetate ( 50 mL ) was then added and the solution was poured into a solution of sodium hydrogen carbonate $(100 \mathrm{~mL})$. The mixture was then extracted with ethyl acetate $(3 \times 50 \mathrm{~mL})$. The organic layers were combined, washed with brine ( 100 mL ), dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated in vacuo. Purification by flash column chromatography
(petroleum ether/diethyl ether, $10: 1$ ) gave 1-(tetrahydropyran-2'-yloxy)-4-pentyne (9) ( $1.81 \mathrm{~g}, 100 \%$ ) as a colourless oil. Spectroscopic data were consistent with the literature. ${ }^{31}$ $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 1.46-1.86\left(8 \mathrm{H}, \mathrm{m}, 2-\mathrm{H}_{2}, 3^{\prime}-\mathrm{H}_{2}, 4^{\prime}-\mathrm{H}_{2}\right.$ and $\left.5^{\prime}-\mathrm{H}_{2}\right), 1.94(1 \mathrm{H}, \mathrm{t}, J 2.7 \mathrm{~Hz}, 5-\mathrm{H}), 2.28-2.35\left(2 \mathrm{H}, \mathrm{m}, 3-\mathrm{H}_{2}\right)$, $3.45-3.55\left(2 \mathrm{H}, \mathrm{m}, 1-\mathrm{HH}\right.$ and $\left.6^{\prime}-\mathrm{HH}\right), 3.80-3.91(2 \mathrm{H}, \mathrm{m}, 1-\mathrm{H} H$ and $\left.6^{\prime}-\mathrm{H} H\right), 4.60\left(1 \mathrm{H}, \mathrm{t}, J 3.3 \mathrm{~Hz}, 2^{\prime}-\mathrm{H}\right)$; $\delta_{\mathrm{C}}\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ $15.1\left(\mathrm{CH}_{2}\right), 19.2\left(\mathrm{CH}_{2}\right), 25.4\left(\mathrm{CH}_{2}\right), 28.6\left(\mathrm{CH}_{2}\right), 30.4\left(\mathrm{CH}_{2}\right)$, $61.7\left(\mathrm{CH}_{2}\right), 65.4\left(\mathrm{CH}_{2}\right), 68.5(\mathrm{CH}), 83.6(\mathrm{C}), 98.4(\mathrm{CH}) ; m / z(\mathrm{EI})$ 168 ( $\mathrm{M}^{+} .4 \%$ ), 149 (8), 125 (11), 111 (12), 84 (74), 67 (28), 49 (100).

## 5-(Benzyldimethylsilyl)-1-(tetrahydropyran-2'-yloxy)pent-4yne (10) ${ }^{32}$

$n$-Butyllithium ( $2.56 \mathrm{~mL}, 6.40 \mathrm{mmol}, 2.5 \mathrm{M}$ in hexane) was slowly added to a stirred solution of 1-(tetrahydropyran-2'-yloxy)-4-pentyne (9) ( $0.980 \mathrm{~g}, 5.82 \mathrm{mmol}$ ) in tetrahydrofuran $(28 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$. The resulting solution was stirred at $-78^{\circ} \mathrm{C}$ for 0.5 h at which time benzyldimethylsilyl chloride ( 1.16 mL , 6.40 mmol ) was added. The resulting solution was stirred at $-78{ }^{\circ} \mathrm{C}$ for 5 h . The reaction was quenched with a saturated solution of ammonium chloride ( 20 mL ) and extracted with diethyl ether $(3 \times 20 \mathrm{~mL})$. The combined organic layers were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and concentrated in vacuo. Purification by flash column chromatography (petroleum ether/diethyl ether, 8:2) gave 5-(benzyldimethylsilyl)-1-(tetrahydropyran-2'-yloxy)-4-pentyne (10) (1.84 g, 100\%) as a colourless oil. Spectroscopic data were consistent with the literature. ${ }^{32} \delta_{\mathrm{H}}$ $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 0.10\left(6 \mathrm{H}, \mathrm{s}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right), 1.47-1.87(8 \mathrm{H}, \mathrm{m}$, $2-\mathrm{H}_{2}, 3^{\prime}-\mathrm{H}_{2}, 4^{\prime}-\mathrm{H}_{2}$ and $\left.5^{\prime}-\mathrm{H}_{2}\right), 2.18\left(2 \mathrm{H}, \mathrm{s}, \mathrm{SiCH}_{2}\right), 2.35(2 \mathrm{H}, \mathrm{t}$, $\left.J 7.1 \mathrm{~Hz}, 3-\mathrm{H}_{2}\right), 3.42-3.54\left(2 \mathrm{H}, \mathrm{m}, 1-\mathrm{HH}\right.$ and $\left.6^{\prime}-\mathrm{HH}\right), 3.79-3.91$ $\left(2 \mathrm{H}, \mathrm{m}, 1-\mathrm{H} H\right.$ and $\left.6^{\prime}-\mathrm{H} H\right), 4.60\left(1 \mathrm{H}, \mathrm{t}, J 3.3 \mathrm{~Hz}, 2^{\prime}-\mathrm{H}\right), 7.05-7.12$ $(3 \mathrm{H}, \mathrm{m}, 3 \times \mathrm{ArH}), 7.19-7.25(2 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}}(101 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 0.0\left(2 \times \mathrm{CH}_{3}\right), 18.7\left(\mathrm{CH}_{2}\right), 21.4\left(\mathrm{CH}_{2}\right), 27.4\left(\mathrm{CH}_{2}\right), 28.4$ $\left(\mathrm{CH}_{2}\right), 30.7\left(\mathrm{CH}_{2}\right), 32.6\left(\mathrm{CH}_{2}\right), 64.0\left(\mathrm{CH}_{2}\right), 67.7\left(\mathrm{CH}_{2}\right), 85.0(\mathrm{C})$, $100.6(\mathrm{CH}), 110.2(\mathrm{C}), 126.2(\mathrm{CH}), 130.0(2 \times \mathrm{CH}), 130.3$ $(2 \times \mathrm{CH}), 141.1(\mathrm{C}) ; \mathrm{m} / \mathrm{z}(\mathrm{ESI}) 339\left(\mathrm{MNa}^{+} .100 \%\right)$.

## 5-(Benzyldimethylsilyl)pent-4-yn-1-ol (11) ${ }^{17}$

$p$-Toluenesulfonic acid monohydrate ( $0.008 \mathrm{~g}, 0.042 \mathrm{mmol}$ ) was added to a solution of 5-(benzyldimethylsilyl)-1-(tetra-hydropyran-2'-yloxy)pent-4-yne (10) ( $0.085 \mathrm{~g}, 0.270 \mathrm{mmol}$ ) in methanol ( 3 mL ). The resulting solution was stirred at room temperature for 18 h . The reaction was quenched by addition of brine ( 50 mL ). The aqueous layer was extracted with ethyl acetate $(3 \times 50 \mathrm{~mL})$. The combined organic layers were dried ( $\mathrm{MgSO}_{4}$ ), filtered, and concentrated in vacuo. Purification by flash column chromatography (petroleum ether/diethyl ether, 1:1) gave 5-(benzyldimethylsilyl)pent-4-yn-1-ol (11) ( 0.065 g , $100 \%$ ) as a colourless oil. Spectroscopic data were consistent with the literature. ${ }^{17} \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 0.12(6 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right)$, $1.76\left(2 \mathrm{H}\right.$, quin., $\left.J 6.5 \mathrm{~Hz}, 2-\mathrm{H}_{2}\right), 1.86(1 \mathrm{H}, \mathrm{s}, \mathrm{OH})$, $2.19\left(2 \mathrm{H}, \mathrm{s}, \mathrm{SiCH}_{2}\right), 2.35\left(2 \mathrm{H}, \mathrm{t}, J 6.5 \mathrm{~Hz}, 3-\mathrm{H}_{2}\right), 3.72(2 \mathrm{H}, \mathrm{t}$, $\left.J 6.5 \mathrm{~Hz}, 1-\mathrm{H}_{2}\right), 7.06-7.13(3 \mathrm{H}, \mathrm{m}, 3 \times \mathrm{ArH}), 7.21-7.27(2 \mathrm{H}, \mathrm{m}$, $2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}}\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 0.0\left(2 \times \mathrm{CH}_{3}\right), 18.4\left(\mathrm{CH}_{2}\right), 28.4$

## Ethyl (2E)-7-(tert-butyldimethylsilyl)hept-2-en-6-ynoate (12)

Dimethyl sulfoxide ( $0.176 \mathrm{~mL}, 2.48 \mathrm{mmol}$ ) was added to a stirred solution of oxalyl chloride ( $0.120 \mathrm{~mL}, 1.39 \mathrm{mmol}$ ) in dichloromethane ( 5 mL ) at $-78{ }^{\circ} \mathrm{C}$. The mixture was stirred for 0.3 h before 5 -(tert-butyldimethylsilyl)-pent-4-yn-1-ol (8) $(0.196 \mathrm{~g}, 0.990 \mathrm{mmol})$ in dichloromethane ( 2 mL ) was slowly added. The mixture was stirred for a further 0.3 h before triethylamine ( $0.690 \mathrm{~mL}, 4.95 \mathrm{mmol}$ ) was added. This reaction mixture was stirred for 0.5 h at $-78{ }^{\circ} \mathrm{C}$ and then allowed to warm to room temperature and stirred for a further 3 h . A solution of lithium chloride ( $0.750 \mathrm{~g}, 1.78 \mathrm{mmol}$ ), triethyl phosphonoacetate ( $0.354 \mathrm{~mL}, 1.78 \mathrm{mmol}$ ) and 1,8-diazabicyclo [5,4,0]undec-7-ene ( $2.66 \mathrm{~mL}, 1.78 \mathrm{mmol}$ ) in acetonitrile ( 4 mL ) was then prepared and stirred for 1 h . The Swern solution was concentrated in vacuo, then the Horner-Wadsworth-Emmons solution was added and the reaction mixture was stirred at room temperature overnight. The reaction was quenched with a saturated solution of ammonium chloride ( 2.5 mL ) and concentrated to give an orange residue, which was then extracted with diethyl ether $(4 \times 5 \mathrm{~mL})$. The organic layers were combined, dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated in vacuo. Purification by flash column chromatography (petroleum ether/ethyl acetate, 7:3) gave ethyl (2E)-7-(tert-butyldimethylsilyl)hept-2-en-6-ynoate (12) ( $0.211 \mathrm{~g}, 80 \%$ ) as a colourless oil. $\nu_{\max } / \mathrm{cm}^{-1}$ (neat) 2929 (CH), 2364, 1723 (C=O), $1472,1250,1040,837 ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 0.07(6 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right), 0.91\left(9 \mathrm{H}, \mathrm{s}, \mathrm{SiC}\left(\mathrm{CH}_{3}\right)_{3}\right), 1.28(3 \mathrm{H}, \mathrm{t}, J 7.1 \mathrm{~Hz}$, $\left.\mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 2.34-2.45\left(4 \mathrm{H}, \mathrm{m}, 4-\mathrm{H}_{2}\right.$ and $\left.5-\mathrm{H}_{2}\right), 4.18(2 \mathrm{H}, \mathrm{q}$, $\left.J 7.1 \mathrm{~Hz}, \mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 5.88(1 \mathrm{H}, \mathrm{d}, J 15.7 \mathrm{~Hz}, 2-\mathrm{H}), 6.97(1 \mathrm{H}$, $\mathrm{dt}, J 15.7,6.6 \mathrm{~Hz}, 3-\mathrm{H}) ; \delta_{\mathrm{C}}\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)-4.6\left(2 \times \mathrm{CH}_{3}\right)$, $14.2\left(\mathrm{CH}_{3}\right), 16.4(\mathrm{C}), 18.8\left(\mathrm{CH}_{2}\right), 26.0\left(3 \times \mathrm{CH}_{3}\right), 31.3\left(\mathrm{CH}_{2}\right)$, $60.2\left(\mathrm{CH}_{2}\right), 84.0(\mathrm{C}), 105.8(\mathrm{C}), 122.5(\mathrm{CH}), 146.5(\mathrm{CH}), 166.3$ (C); m/z (ESI) $289.1590 \quad\left(\mathrm{MNa}^{+} . \mathrm{C}_{15} \mathrm{H}_{26} \mathrm{NaO}_{2} \mathrm{Si}\right.$ requires 289.1594).

## Ethyl (2E)-7-(benzyldimethylsilyl)hept-2-en-6-ynoate (13)

Ethyl (2E)-7-(benzyldimethylsilyl)hept-2-en-6-ynoate (13) was synthesised as described for ethyl (2E)-7-(tert-butyldimethyl-silyl)hept-2-en-6-ynoate (12) using 5-(benzyldimethylsilyl)pent4 -yn-1-ol (11) ( $0.990 \mathrm{~g}, 4.28 \mathrm{mmol}$ ). Purification by flash column chromatography (petroleum ether/diethyl ether, 8:2) gave ethyl (2E)-7-(benzyldimethylsilyl)hept-2-en-6-ynoate (13) $(1.19 \mathrm{~g}, 92 \%)$ as a colourless oil. $\nu_{\max } / \mathrm{cm}^{-1}$ (neat) 2958 (CH), $1720(\mathrm{C}=\mathrm{O}), 1656(\mathrm{C}=\mathrm{C}), 1494,1249,1154,1039,833,758$; $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 0.10\left(6 \mathrm{H}, \mathrm{s}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right), 1.29(3 \mathrm{H}, \mathrm{t}, J 7.1$ $\left.\mathrm{Hz}, \mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 2.18\left(2 \mathrm{H}, \mathrm{s}, \mathrm{SiCH}_{2}\right), 2.34-2.45(4 \mathrm{H}, \mathrm{m}$, $4-\mathrm{H}_{2}$ and $\left.5-\mathrm{H}_{2}\right), 4.20\left(2 \mathrm{H}, \mathrm{q}, J 7.1 \mathrm{~Hz}, \mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 5.87(1 \mathrm{H}, \mathrm{dt}$, $J 15.7,1.4 \mathrm{~Hz}, 2-\mathrm{H}), 6.97(1 \mathrm{H}, \mathrm{dt}, J 15.7,6.6 \mathrm{~Hz}, 3-\mathrm{H}), 7.03-7.12$ $(3 \mathrm{H}, \mathrm{m}, 3 \times \mathrm{ArH}), 7.19-7.25(2 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}}(101 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 0.0\left(2 \times \mathrm{CH}_{3}\right), 16.3\left(\mathrm{CH}_{3}\right), 20.8\left(\mathrm{CH}_{2}\right), 28.3\left(\mathrm{CH}_{2}\right)$, $33.1\left(\mathrm{CH}_{2}\right), 62.2\left(\mathrm{CH}_{2}\right), 86.3(\mathrm{C}), 108.8(\mathrm{C}), 124.5(\mathrm{CH}), 126.3$ $(\mathrm{CH}), 130.1(2 \times \mathrm{CH}), 130.3(2 \times \mathrm{CH}), 141.0(\mathrm{C}), 148.4(\mathrm{CH})$,
168.2 (C); $m / z$ (ESI) $323.1422\left(\mathrm{MNa}^{+} . \mathrm{C}_{18} \mathrm{H}_{24} \mathrm{NaO}_{2}\right.$ Si requires 323.1438).

## (2E)-7-(tert-Butyldimethylsilyl)hept-2-en-6-yn-1-ol (14)

Ethyl (2E)-7-(tert-butyldimethylsilyl)hept-2-en-6-ynoate
( $0.165 \mathrm{~g}, 0.620 \mathrm{mmol}$ ) was dissolved in diethyl ether ( 4 mL ) and cooled to $-78{ }^{\circ} \mathrm{C}$. DIBAL-H ( 1 M in hexane) ( 1.36 mL , 1.36 mmol ) was added dropwise and the reaction mixture was stirred at $-78^{\circ} \mathrm{C}$ for 3 h , before warming to room temperature overnight. The solution was cooled to $0^{\circ} \mathrm{C}$ and quenched by the addition of a saturated solution of Rochelle salt ( 2 mL ) and warmed to room temperature with vigorous stirring for 1 h , producing a white precipitate that was filtered through a pad of Celite ${ }^{\circledR}$ and washed with diethyl ether $(3 \times 4 \mathrm{~mL})$. The filtrate was then dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated in vacuo. Purification by flash column chromatography (petroleum ether/ethyl acetate, 8:2) gave (2E)-7-(tert-butyldimethyl-silyl)hept-2-en-6-yn-1-ol (14) ( $0.128 \mathrm{~g}, 92 \%$ ) as a colourless oil. $\nu_{\text {max }} / \mathrm{cm}^{-1}$ (neat) $3332(\mathrm{OH}), 2929(\mathrm{CH}), 2174,1472,1250,1007$, $968,837,825,774 ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 0.07\left(6 \mathrm{H}, \mathrm{s}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right)$, $0.92\left(9 \mathrm{H}, \mathrm{s}, \mathrm{SiC}\left(\mathrm{CH}_{3}\right)_{3}\right), 1.32(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{OH}), 2.23-2.39(4 \mathrm{H}, \mathrm{m}$, $4-\mathrm{H}_{2}$ and $\left.5-\mathrm{H}_{2}\right), 4.09\left(2 \mathrm{H}\right.$, br t, $\left.J 4.6 \mathrm{~Hz}, 1-\mathrm{H}_{2}\right), 5.66-5.78(2 \mathrm{H}$, $\mathrm{m}, 2-\mathrm{H}$ and $3-\mathrm{H}) ; \delta_{\mathrm{C}}\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)-4.5\left(2 \times \mathrm{CH}_{3}\right), 16.5(\mathrm{C})$, $19.9\left(\mathrm{CH}_{2}\right), 26.0\left(3 \times \mathrm{CH}_{3}\right), 31.5\left(\mathrm{CH}_{2}\right), 63.5\left(\mathrm{CH}_{2}\right), 83.1(\mathrm{C})$, $107.0(\mathrm{C}), 130.4(\mathrm{CH}), 130.8(\mathrm{CH}) ; \mathrm{m} / \mathrm{z}(\mathrm{ESI}) 247.1479\left(\mathrm{MNa}^{+}\right.$. $\mathrm{C}_{13} \mathrm{H}_{24} \mathrm{NaOSi}$ requires 247.1489).

## (2E)-7-(Benzyldimethylsilyl)hept-2-en-6-yn-1-ol (15)

(2E)-7-(Benzyldimethylsilyl)hept-2-en-6-yn-1-ol (15) was synthesised as described for (2E)-7-(tert-butyldimethylsilyl)hept-2-en-6-yn-1-ol (14) using ethyl (2E)-7-(benzyldimethylsilyl)hept-2-en-6-ynoate (13) ( $1.35 \mathrm{~g}, 4.49 \mathrm{mmol}$ ). Purification by flash column chromatography (petroleum ether/ethyl acetate, 9:1) gave (2E)-7-(benzyldimethylsilyl)hept-2-en-6-yn-1-ol (15) $(1.14 \mathrm{~g}, 98 \%)$ as a colourless oil. $\nu_{\max } / \mathrm{cm}^{-1}$ (neat) $3367(\mathrm{OH})$, 2922 (CH), 2175, 1494, 1249, 838, 762, 698; $\delta_{\mathrm{H}}(500 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 0.11\left(6 \mathrm{H}, \mathrm{s}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right), 1.43(1 \mathrm{H}$, br s, OH$), 2.18(2 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{SiCH}_{2}\right), 2.23-2.34\left(4 \mathrm{H}, \mathrm{m}, 4-\mathrm{H}_{2}\right.$ and $\left.5-\mathrm{H}_{2}\right), 4.10(2 \mathrm{H}, \mathrm{d}, J 4.4 \mathrm{~Hz}$, $\left.1-\mathrm{H}_{2}\right), 5.65-5.76(2 \mathrm{H}, \mathrm{m}, 2-\mathrm{H}$ and $3-\mathrm{H}), 7.06-7.12(3 \mathrm{H}, \mathrm{m}$, $3 \times \mathrm{ArH}), 7.20-7.25(2 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}}\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 0.0$ $\left(2 \times \mathrm{CH}_{3}\right) 21.8\left(\mathrm{CH}_{2}\right), 28.4\left(\mathrm{CH}_{2}\right), 33.2\left(\mathrm{CH}_{2}\right), 65.4\left(\mathrm{CH}_{2}\right), 85.5$ (C), $109.9(\mathrm{C}), 126.2(\mathrm{CH}), 130.0(2 \times \mathrm{CH}), 130.3(2 \times \mathrm{CH}), 132.3$ (CH), 132.6 (CH), 141.1 (C); $m / z$ (ESI) $281.1323\left(\mathrm{MNa}^{+}\right.$. $\mathrm{C}_{16} \mathrm{H}_{22} \mathrm{NaOSi}$ requires 281.1332).
( $3 \mathrm{a} S^{*}, 8 R^{*}, 8 \mathrm{a} S^{*}, 8 \mathrm{~b} R^{*}$ )-5-(tert-Butyldimethylsilyl)-3a,4,6,7,8a,8b-hexahydro-2-phenyl-8-( $2^{\prime}, 2^{\prime}, 2^{\prime}$-trichloromethylcarbonylamino) cyclopent $[e]$ isoindole- $1,3(2 H, 3 a H)$-dione (16)
(2E)-7-(tert-Butyldimethylsilyl)hept-2-en-6-yn-1-ol (14) (0.054 g, 0.240 mmol ) was dissolved in dichloromethane ( 6 mL ) and cooled to $0^{\circ} \mathrm{C}$. To the solution 1,8 -diazabicyclo[5.4.0]undec-7ene $(0.007 \mathrm{~mL}, 0.048 \mathrm{mmol})$ and trichloroacetonitrile ( $0.036 \mathrm{~mL}, 0.360 \mathrm{mmol}$ ) were added. The reaction mixture was allowed to warm to room temperature and stirred for 3 h . The reaction mixture was filtered through a short pad of silica gel with diethyl ether ( 100 mL ) and the filtrate concentrated
in vacuo to give the allylic trichloroacetimidate, which was used without further purification. The allylic trichloroacetimidate was dissolved in toluene ( 6 mL ) and bis(acetonitrile)palladium chloride ( $0.006 \mathrm{~g}, 0.024 \mathrm{mmol}$ ) was then added and the reaction mixture was stirred at room temperature for 12 h . Grubbs second generation catalyst ( $0.020 \mathrm{~g}, 0.024 \mathrm{mmol}$ ) was added with 1,7 -octadiene ( $0.142 \mathrm{~mL}, 0.960 \mathrm{mmol}$ ) and the reaction mixture was stirred for 60 h at $90{ }^{\circ} \mathrm{C}$. A second portion of Grubbs second generation catalyst $(0.020 \mathrm{~g}$, 0.024 mmol ) was added with 1,7 -octadiene ( 0.142 mL , 0.960 mmol ) and the reaction mixture was stirred for further 60 h at $90^{\circ} \mathrm{C}$. $N$-Phenyl maleimide ( $0.062 \mathrm{~g}, 0.360 \mathrm{mmol}$ ) was added with hydroquinone $(0.003 \mathrm{~g}, 0.030 \mathrm{mmol})$. The reaction mixture was stirred for 18 h at $75^{\circ} \mathrm{C}$. The reaction mixture was then cooled and the solvent was evaporated. Flash column chromatography (petroleum ether/ethyl acetate, 8:2) gave (3a $S^{*}, 8 R^{*}, 8 \mathrm{a} S^{*}, 8 \mathrm{~b} R^{*}$ )-5-(tert-butyldimethylsilyl)-3a, 4, $6,7,8 \mathrm{a}, 8 \mathrm{~b}-$ hexahydro-2-phenyl-8-(2', $2^{\prime}, 2^{\prime}$-trichloromethylcarbonylamino) cyclopent $[e]$ isoindole-1,3(2H,3aH)-dione (16) ( $0.025 \mathrm{~g}, 19 \%$ ) as a yellow oil. $\nu_{\max } / \mathrm{cm}^{-1}$ (neat) 3319 (NH), 2954 (CH), 1699 $(\mathrm{C}=\mathrm{O}), 1517(\mathrm{C}=\mathrm{C}), 1388,1199,827,755 ; \delta_{\mathrm{H}}(400 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 0.08\left(3 \mathrm{H}, \mathrm{s}, \mathrm{SiCH}_{3}\right), 0.15\left(3 \mathrm{H}, \mathrm{s}, \mathrm{SiCH}_{3}\right), 0.86(9 \mathrm{H}, \mathrm{s}, \mathrm{SiC}$ $\left.\left(\mathrm{CH}_{3}\right)_{3}\right), 1.83(1 \mathrm{H}$, ddd, $J 18.6,12.4,7.6 \mathrm{~Hz}, 7-H \mathrm{H}), 2.12-2.21$ $(2 \mathrm{H}, \mathrm{m}, 4-\mathrm{HH}$ and $7-\mathrm{HH}), 2.24-2.38(1 \mathrm{H}, \mathrm{m}, 6-\mathrm{HH}), 2.65(1 \mathrm{H}$, dd, $J 16.5,7.6 \mathrm{~Hz}, 6-\mathrm{H} H), 2.92-2.98(1 \mathrm{H}, \mathrm{m}, 8 \mathrm{a}-\mathrm{H}), 3.01(1 \mathrm{H}$, dd, $J 14.8,1.3 \mathrm{~Hz}, 4-\mathrm{H} H), 3.32(1 \mathrm{H}$, ddd, $J 8.9,7.2,1.3 \mathrm{~Hz}, 3 \mathrm{a}-$ H), $3.40(1 \mathrm{H}, \mathrm{dd}, J 8.9,6.3 \mathrm{~Hz}, 8 \mathrm{~b}-\mathrm{H}), 4.77-4.88(1 \mathrm{H}, \mathrm{m}, 8-\mathrm{H})$, 7.12-7.17 ( $2 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{ArH}$ ), 7.37-7.50 ( $3 \mathrm{H}, \mathrm{m}, 3 \times \mathrm{ArH}$ ), 8.84 $(1 \mathrm{H}, \mathrm{d}, J 9.6 \mathrm{~Hz}, \mathrm{NH}) ; \delta_{\mathrm{C}}\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)-5.1\left(\mathrm{CH}_{3}\right),-4.2$ $\left(\mathrm{CH}_{3}\right), 18.3(\mathrm{C}), 26.8\left(3 \times \mathrm{CH}_{3}\right), 30.3\left(\mathrm{CH}_{2}\right), 30.5\left(\mathrm{CH}_{2}\right), 31.9$ $\left(\mathrm{CH}_{2}\right), 39.3(\mathrm{CH}), 40.6(\mathrm{CH}), 43.1(\mathrm{CH}), 52.3(\mathrm{CH}), 92.9(\mathrm{C})$, $126.4(2 \times \mathrm{CH}), 128.8(\mathrm{C}), 129.0(\mathrm{CH}), 129.3(2 \times \mathrm{CH}), 131.5(\mathrm{C})$, 156.1 (C), 162.3 (C), 178.1 (C), 179.8 (C); m/z (ESI) 563.1045 ( $\mathrm{MNa}^{+} . \mathrm{C}_{25} \mathrm{H}_{31}{ }^{35} \mathrm{Cl}_{3} \mathrm{~N}_{2} \mathrm{NaO}_{3} \mathrm{Si}$ requires 563.1062 ).

12 Mono-substituted alkyne derived allylic trichloroacetimidates are poor substrates for a palladium(II)-catalysed Overman rearrangement due to binding of the catalyst to the alkyne moiety. For these compounds, a high temperature thermal Overman rearrangement is required for preparation of the allylic trichloroacetamide.
