An overview of chemical constituents from *Alpinia* species in the last six decades†

Xiao-Ni Ma,ab Chun-Lan Xie,ab Zi Miao,a Quan Yangb and Xian-Wen Yang*a

*Alpinia* species is one of the most important genera of the Zingiberaceae family. In Asia, they have been widely used as food and traditional medicines for centuries. This review focuses on their chemical constituents and their relevant biological activities with 252 references covering from 1955 to 2015. In total, 544 compounds were isolated from 35 *Alpinia* species. The major ones are terpenoids (207) and diarylheptanoids (143). The crude extracts and identified compounds exhibited a broad spectrum of bioactivities including antiemetic, antiulcer, antibacterial, anti-inflammatory, anti-amnesic, anticancer, etc.

Up to 2015, this genus contributed about 252 papers. However, only seven review articles were published, five of which were on chemical constituents and biological activities of single plant. And the rest two were on two major components of *Alpinia* species. The first review came out in 2010 regarding distributions, physiological activities and 13C NMR spectroscopic data of 307 naturally occurring diarylheptanoids, which were mainly isolated from *Alpinia* species.41 In 2011, the pharmacological and phytochemical studies of *A. galanga* (L.) Willd were summarized with 30 references. Although it was claimed to concern new phytoconstituents that have appeared in recent years for *A. galangal*, it actually collected all reported compounds including volatile oil.42 In 2012, structural characterization and biological effects of constituents from the seeds of *A. katsumadai* was described. Sixty compounds were reported together with their structures and bioactivities with 18 references.43 In 2013, chemical constituents in fruits of *A. oxyphylla* and their pharmacological activities were summarized. Eighty-five compounds were obtained from this species between 2001 and 2012, with the major component of sesquiterpenes (61.2%). It possessed a variety of pharmacological activities, including neuroprotection, learning and memory-improving function, antianxiety, anti-aging, anti-inflammation, and anti-anaphylaxis.44 In 2015, a comprehensive review on the ethnomedical uses, chemical constituents, and the pharmacological profile of *A. calcarata* Roscoe was published with particular attention given to the pharmacological effects of the essential oil.45 In the same year, the phytochemistry of *A. purpurata* with pharmacological properties of antioxidant, antibacterial, larvicidal, cytotoxic, and vasodilator activities were reported together with another ornamental ginger, *Hedychium coronarium*. As a matter of fact, little research was performed on *A. purpurata*.46 In addition, the isolation, synthesis, and characterization of dihydro-5,6-dehydrokavain, the major constituent of *A. zerumbet* were also reviewed.47 However, so far there has been no comprehensive review for chemical constituents of this species. Herein, we describe all isolated compounds and their...
relevant bioactivities of *Alpinia* species reported in the last six decades from 1955 to 2015.

2. Terpenoids

2.1. Monoterpenoids

A total number of 17 monoterpenoids were obtained from *Alpinia* species (Fig. 1). Rubraine (1), isorubraine (2), and sumadain C (3) were three new monoterpenene–chalcone conjugates obtained from *A. katsumadai*. They were tested for cytotoxic activities against three tumor cell lines of HepG2, MCF-7, and MAD-MB-435. Sumadain C (3) exhibited very weak effect with IC_{50} value of around 40.0 μM.*** While *A. densibracteata* T. L. Wu and Senjen yielded two diastereoisomers of cinnamate conjugate, katsumadain (4) and a new (E)-1-(1-terpinen-4-0yl)-3-methoxystilbene (5).*** While *A. densibracteata* T. L. Wu and Senjen yielded two diastereoisomers of cinnamate esters, 2α-cinnamoyl cineole (6) and 2β-cinnamoyl cineole (7).*** From rhizomes of *A. tonkinensis* Gagnep., 2α-(p-hydroxycinnamyl) cineole (8) was isolated. Two endoperoxides, (1S,4R,6R)-1,4-epidioxy-p-menth-2-ene (9) and (1R,4S,6R)-1,4-epidioxy-p-menth-2-ene (10), were isolated from aerial parts of *A. densibracteata* T. L. Wu and Senjen.*** While (3R,4R,6S)-3,6-dihydroxy-1-methene (11) and 1-terpinen-4-ol (12) were obtained from *A. sichuansensis* Z. Y. Zhu [a synonym of *A. jiangangfeng* T. L. Wu] and *A. katsumadai* Hayata, respectively.*** Fruit of *A. oxyphylla* Miq. was the source of (1R,2R)-p-menth-3-ene-1,2-diol (13).*** And aerial parts of *A. densibracteata* T. L. Wu and Senjen yielded 3,4-dihydroxy-p-menth-1-ene (14).*** Compounds 15–17 were three hydroxyl-1,8-cineole glucopyranosides, which were mainly isolated from rhizomes of *A. galinga* (L.) Willd.***

2.2. Sesquiterpenoids

To date, 132 sesquiterpenoids were reported from *Alpinia* species (Fig. 2). They were divided into acyclic sesquiterpenoids (18 and 19), eremophilanes (20–40), eudesmanes (41–84), cadinanes (85–100), guaianes (101–117), carphophilanes (118–120), bisabolanes (121–137), humulanes (138–140), drimane (141), elemene (142), arocarbane (143), oplopane (144), and others (145–149).

Seeds of *A. katsumadai* Hayata produced an acyclic sesqui-terpenoid, *trans,trans-farnesol* (18), which exerted weak neuraminidase inhibitory activity in vitro (IC_{50} = 81.4 μM.*** Norerolidol (19), another acyclic sesquiterpene, was obtained from rethizoms of *A. japonica*.***

Investigations on fruits of *A. oxyphylla* Miq. afforded 16 eremophilanes (20–35). Epinoottakal (29) and noottakatone (30) displayed insecticidal activities against larvae and adults of *Drosophila melanogaster* with IC_{50} values of 11.5 μM and 96 μg per adult, respectively.*** While 9β-hydroxyoottakatone (31), (11S,12)-12-chloronoottakaton-11-ol (32), and (11R)-12-chloronoottakaton-11-ol (33) displayed anti-acetylcholinesterase (AChE) activities by TLC-bioautographic assays.*** 12-Norooottakaton-6-en-11-one (35) was a novel nor-eremophilane. It showed potent anti-AChE bioactivity at 10 nM using the same TLC-bioautographic assay.*** The rest of five eremophilanes (36–40) were isolated from three different species. Eremophilene-10β-ol (36) and eremophilene-11-ol (37) were obtained from *A. intermedia* Gagnep. and *A. japonica* (Thunb.) Miq., respectively,*** whilst noottakatene (38), valencene (39), and dehydro-nootkatone (40) were all identified from *A. oxyphylla* Miq.*** Among 44 eudesmane sesquiterpenoids, oxyphylloses A and B (41 and 42) were isolated from *A. oxyphylla*. They were the first two examples of 4,5-secoeudesmanes in the Zingiberaceae family.*** Oxyphyllose A displayed moderate anti-AChE activity.*** Also obtained from *A. oxyphylla* Miq. were compounds 43–63.*** *A. intermedia* Gagnep. was the source of intermedeol (64) and β-selinene (65).*** Investigations of *A. japonica* (Thunb.) Miq. led to the identification of 66–75. Two novel trinor-eudesmanes, oxyphyllosanes A (76) and B (77) were obtained from *A. oxyphylla*, together with four known ones (78–81).*** Investigation on *A. oxyphylla* Miq. provided three nor-eudesmane sesquiterpenoids, oxyphyllosane C (82), (5R,7S,10S)-5-hydroxy-13-nor-eudesma-3-en-2,11-diene (83), and 4-methoxy-oxyphyllose A (84).***

A new 1,10-seco-15-norcadinane sesquiterpene nominated oxy-phenol A (85) was isolated from *A. oxyphylla*.*** Fruits of *A. oxyphylla* Miq. also provided one tricyclic sesquiterpene, mustakone (86), nine nor-cadinanes, 87–94 and 2β-hydroxy-5-cadinol (95), 96,97,98,99,100 *A. oxyntira* K. Schum. was the source of (−)(1R,4S)-8-hydroxy-13-calamenene acid (96).*** Alpinipentane A (97) was provided by *A. officinarum* Hance, while 4(15)-cadinene-6,10-diol (98) by *A. tonkinensis* Gagnep.*** Two new compounds (99 and 100) were isolated from fruits of *A. oxyphylla* Miq. and 100 exhibited moderate hypoglycemic activity with inhibitory rate of 11.5%, compared to 41.9% of the positive control acarbose (41.9%) at 90 μM.***

Rhizomes of *A. japonica* (Thunb.) Miq. produced alpinenone (101), an inhibitor of AChE,102,103 Hanamoly (102), containing a cyclic ether linkage, was also isolated from *A. japonica* (Thunb.) Miq.*** Rhizomes of *A. intermedia* Gagnep. provided hanapilin peroxide (103), isohanapilin (104), and aokunanol (105).*** While *A. intermedia* Gagnep. and *A. japonica* (Thunb.) Miq. produced hanapilin (106), hanapilinone (107), and isohanapilinone (108).*** From *A. japonica* (Thunb.) Miq. and *A. intermedia* Gagnep., furoperlagones A (109) and B (110) were obtained.106,108,109 Later on, 110 was also found from *A. formosannosa*.*** Compounds 111–114 were four seco-guaiaine-type sesquiterpenes with an α,β-unsaturated butenolide. *A. intermedia* Gagnep. produced epialpinolide (111), whilst *A. japonica* (Thunb.) Miq. yielded alpinolide peroxide (112), 6-hydroxy-alpinolide (113), and alpinolide (114).*** A 1,10-seco-guaiiane sesquiterpene, (+)-mandassidion (115), and two 1,10-seco-15-norguaiane sesquiterpenes, mandassions A (116) and B (117) were obtained from fruits of *A. oxyphylla* Miq.***

Caryophyllene oxide (118), caryophyllenol-I (119), and caryophyllenol-II (120) were caryophyllenes from *A. galantai*.*** In addition, caryophyllene oxide was also distributed in rhizomes of *A. conchigera* Griff.*** Investigation of the aerial parts of *A. densibracteata* T. L. Wu and Senjen led to the isolation of two bisabolane endoperoxides (121 and 122), three bisabolane hydroperoxides (123–125), and one 3,4-dihydroxy-bisabol-1,10-diene (126).*** Compounds 127–137 were reported from rhizomes of *A. japonica* (Thunb.) Miq.*** *A. oxyphylla* Miq. was the source of 3(12),7(13),9(15)-humulatriene-2,6-diol (138).*** While *A. formosannosa* and *A. japonica* produced humulene epoxideII (139), (9E)-Humulene-2,3,6-diepoxide (140) was reported from the fruits of *A. oxyphylla* Miq.*** However, its relative configuration remained undetermined. It
exhibited moderate anti-AChE activity in bioautographic assay at 10 nM. Interestingly, the structure and molecular formula for (CAS Registry Number: 21956-93-4) provided by SciFinder were not correct. It should be C_{15}H_{24}O_{2} instead of C_{14}H_{21}O_{2}.

Rhizomes of *A. calcarata* Rosc. afforded a drimane-type sesquiterpene (γ-bicyclohomofarnesal, 141), and an elemene one (shyobunone, 142). Pubescone (143) was isolated from *A. oxyphylla* Miq. and showed weak anti-AChE activity at the concentration of 100 μM. (−)-Oplopanone (144) and oxypollone F (145) were obtained from fruits of *A. oxyphylla* Miq. (1S,4R,6R)-1,4-Epoxypinane-3,6-diol (146) was a novel nor-sesquiterpene incorporating cyclobutene ring from *A. oxyphylla* Miq. Seeds of *A. galanga* (L.) Willd produced caryolane-1,9-b-diol (147), which suppressed the proliferation of four cancer cell lines of HeLa, A549, HepG2, and SMMC-7721 with IC_{50} values ranging from 252 to 378 μM. Compound 2-ethyl-6-isopropyl-7-hydroxymethyl naphthalene (149) was a novel naphthalene from *A. oxyphylla*. It showed bioactive activity with the inhibitory rates of 10.3%, compare to 41.9% of the positive control acarbose at 0.9 mM.

Noteworthily, compounds 22-31, 34, 48-56, 58-63, 79-82, 87-89, 117, and 129-136 exerted NO production inhibitory activities at different levels. While (10R)-13-noreudesma-4,6-dien-3,11-dione (46), (5S,8R,10R)-2-oxoecdema-3,7(11)-dien-12,8-olide (47), (5R,7S,10S)-5-hydroxy-13-noreudesma-3-en-2,11-dione (83), and (4S)-10-nor-calamenen-10-one (90) showed potent auxo-action of NO production at 10 μM induced by lipopolysaccharide (LPS) in microglia.

### 2.3. Diterpenoids

Labdane diterpenes is undoubtedly predominant in Zingiberaceae family, notably in *Alpinia* genus. Almost all diterpenes are...
labdanes (150–205). Only one grayanane diterpene was found (206) (Fig. 3).

(E)-Labda-8(17),12-diene-15,16-dial (150) is widely distributed in *Alpinia*. It exhibited a number of bioactivities, such as antibacterial, α-glucosidase inhibition, NO production inhibition, antifungal, antiglycation, HIV-1 integrase, and neuraminidase inhibitory activities. *A. katsumadai* Hayata, *A. galanga* (L.) Willd, and *A. nigra* yielded (E)-8β,17-epoxylabd-12-
ene-15,16-dial (151). It exhibited extensive antibacterial activities, especially against *Candida guilliermondii* and *Candida tropicalis*.\(^{49,91,93,96}\) Moreover, 151 also showed \(\alpha\)-glucosidase inhibitory activity with IC\(_{50}\) value between 5 \(\mu\)M and 10 \(\mu\)M.\(^{78}\) The \(\alpha\)-glucosidase inhibitory activity of 151 was even much higher than the positive control, acarbose (IC\(_{50} = 400 \mu\)M),
indicating 151 might be a potential candidate as a future anti-diabetic drug.79 A. formosana, A. calcarata Rosc., and A. pahangensis Ridley provided (E)-labda-8(17),12-diene-15-ol-16-al (152),81,85,96 while (E)-labda-8(17),13-dien-15-al (153) was only obtained from A. pahangensis Ridley.86 Flowers of A. chinensis Rosc. provided compounds 154–161.81,85,97 A. tonkinensis

Fig. 2 Sesquiterpenoids from Alpinia species (continued).
Gagnep. and *A. speciosa* K. Schum. (the accepted name is *A. zerumbet* (Pers.) B. L. Burtt & R. M. Sm.) were the sources of (E)-15-nor-16-oxo-8(17),12-labdadiene (162).\(^{5,9}\) Both *A. zerumbet* (Pers.) Burtt and P. M. Smith and *A. pahangensis* Ridley gave birth to zerumin B (163),\(^{9,9}\) (11E)-15,16-Epoxylabda-8(17),11,13-trien-16-ol (164) and (E)-15-hydroxylabda-8(17),11,13-trien-16,15-olide \(^{96,99}\).
(165) were found in the flowers of A. chinensis Rosc. It is noteworthy that 164 was actually a mixture of two epimers. Rhizomes of A. calcarata Rosc. produced calcaratins A–D (166–169) and labda-8(17),11,13-trien-15(16)-olide (170). Rhizomes of A. malaccensis yielded coronarin A (171), coronarin E (172), and hedyforrestin B (173). Coronarin E (172) was also isolated from A.
zerumbet (Pers.) Burtt and P. M. Smith, and A. chinensis Rosc. Three antibacterial constituents, zerumin A (174), pahangensis B (175), and sектрmalbadiane B (176), were isolated from A. pahangensis. Interestingly, zerumin A (174) was also obtained from A. calcarata Rosc. and A. zerumbet (Pers.) Burtt and P. M. Smith. Compound 175 was also found in A. japonica (Thunb.) Miq., with NO production inhibition (IC50 = 34.3 μM) in LPS-induced RAW264.7 macrophages. Galanolactone (177) was isolated from A. katsumadai Hayata and A. galanga. It was reported to have moderate antifungal activity to Candida guilliermondii PW44 and Candida tropicalis PW30 with both MIC values of 25 μg mL−1. Isocoronarin D (178) was found in A. galanga (L.) Willd and A. calcarata Rosc., which weakly suppressed the proliferation of four cancer cells lines of HeLa, A549, HepG2, and SMCC-7721 in a concentration-dependent way with IC50 values ranging from 69.1 to 87.0 μg mL−1. Seeds of A. galanga yielded galaganin (179), which showed moderate cytotoxicity towards DU145, MCF-7, H522, and K562 cells with IC50 values of 8.2, 13.8, 17.8, and 16.1 μM, respectively. Rhizomes of A. pinnanensis T. L. Wu et Senjen produced labda-8(17),13(14)-di-en-15,16-olide (180) and ottensinin (181). A. japonica provided compounds 182–187, of which 182 and 183 were norlabdanes. Compounds 182, 185, and 186 exhibited significant NO production inhibitory effects in LPS-induced RAW264.7 macrophages, with respective IC50 values of 25.9, 14.6, and 25.6 μM, compared to 39.6 μM of the positive control, N-monomethyl-L-arginine (L-NMMA). Ethanol extract of A. oxyzaphylla Miq. provided 188, which showed moderate hypoglycemic effect with inhibitory rates of 10.0% at 60 μM. Ottensinin showed moderate antibacterial activity on the Gram-positive bacteria of Bacillus cereus with MIC value of 0.25 μg mL−1. Alpindenoids A–D (189–192) were four labdane glycosides from A. densuspica Hayata. They didn’t show cytotoxic activities against human tumor cell lines of Hela, KB, Doay, and WiDr at 20 μM. Instead, they all exhibited moderate NO inhibitory activities with IC50 ranging from 30 to 49 μM. Leaves of A. flabellate provided rel-labda-12-en-15(16)-olit-7-one-8R-spiro-1,2S-[2,4,5-trimethoxyphenyl]-3-cyclohexene] (193), a unique labdane diterpene coupled with a phenylbutenoid. Noralpindenoids A (194) and B (195) were two norditerpene glycosides from A. denspica Hayata, both of which showed moderate inhibitory effects on NO production with IC50 values of 34.2 and 49.3 μM, respectively. (E,E)-15-Hydroxyabda-8(17),11,13-trien-16-al (196) and its diastereoisomer (197) from A. chinensis Rosc. may arise by direct oxygenation of (E,E)-15-hydroxyabda-8(17),11,13-trien-16-al. From flowers of A. chinensis Rosc., coronarin B (198) containing a seven-membered endoperoxide hemiacetal was isolated. It should be noted that although the structure and its NMR and MS spectroscopic data referred to coronarin B (CAS number: 119188-38-4) in the reference, the author gave a wrong name for this compound as coronarin C (CAS number: 119188-35-1) which was previously isolated from Hedychium coronarium. Galanals A (199) and B (200) were obtained from A. galanga (L.) Willd. Both compounds showed significant antifungal activities against...
Candida guilliermondii PW44 with MIC values of 12.5 μg mL⁻¹. Furthermore, galanal A exhibited potent cytotoxic activity against KB cells (IC₅₀ = 3.25 μg mL⁻¹).⁷⁹ Compound 201 was a novel metabolite conjugated of labdane diterpene with chalcone from aerial parts of A. katsumadai Hayata.⁴⁹ A. pahangensis Ridley provided pahangensins A (202) and C (203) as antibacterial constituents.⁷⁶,¹⁰⁶ A. pahangensis Ridley produced calcaratarins D (204) and E (205), both of which were cytotoxic against human KB cells in vitro with IC₅₀ value of 0.21 and 0.15 μg mL⁻¹, respectively.¹⁰⁷ From seeds of A. katsumadai Hayata, a grayanane diterpenoid was isolated and characterized as rhodomollein I (206).¹⁰⁹

2.4. Triterpenoids

Up to now, only one triterpene was found from this genus (Fig. 4). It was named as 2,3,22,23-tetrahydroxy-2,6,10,15,19,23-hexamethyl-6,10,14,18-tetracosatetraene (207), an acyclic triterpenoid, isolated from the seeds of A. katsumadai L.¹⁰⁹ It showed weak cholesterol acyltransferase inhibitory activity with IC₅₀ value of 47.9 μM.¹⁰⁹

3. Diarylheptanoids

A total of 143 diarylheptanoids (208–350, Fig. 5) were isolated from Alpinia species, including 66 acyclic diarylheptanoids (208–273), 11 cyclic diarylheptanoids (274–284), 50 diarylheptanoid and flavonoid conjugates (285–334), 10 dimeric diarylheptanoids (335–344), and six others (345–350). Compounds 208–210 were isolated from rhizomes of A. officinarum Hance. They were moderate or weak NO production inhibitors.¹¹⁰ From fruits of A. oxyphylla, oxyphyllacinol (211) and yakuchinones A–B (212–213) were isolated, of which 211 was a NO production inhibitor, while 212 and 213 exhibited anti-tumor activities to human promyelocytic leukemia (HL-60) cells in a concentration-related manner.³²,⁶⁷ In addition, 212...
also possessed insecticidal, anti-adipocyte differentiation, NO production inhibitory, and cardiotonic activities. Compounds 213–216 were also yielded by fruits of A. oxyphylla. Seeds of A. blepharocalyx K. Schum. gave birth to 217–225. Among these compounds, 1,7-bis(4-hydroxyphenyl)-3-hydroxy-1,3-heptadien-5-one (223) significantly inhibited platelet aggregation induced by...
collagen with IC₅₀ value of 14.7 µg mL⁻¹.¹¹⁷ (3S,6E)-Methoxy-1,7-bis(4-hydroxyphenyl)-6-hepten-5-one (224) and (3S,5S)-3,5-dihydroxy-1,7-bis(4-hydroxyphenyl)heptane (225) showed significant antiproliferative activities against murine colon 26-L5 carcinoma and human HT-1080 fibrosarcoma with IC₅₀ values of 5.2 and 12.8 µM, respectively.¹¹⁵,¹¹⁶ Both A. pinnanensis
T. L. Wu et Senjen and A. Katsumadai Hayata provided \((3S,5S)\)-trans-3,5-dihydroxy-1,7-diphenyl-1-heptene \((226)\). It did not show antagonistic activity \((\text{MIC} > 64 \text{ mg L}^{-1})\). Instead, it exhibited weak neuraminidase inhibitory activity \((\text{IC}_{50} = 29.75 \pm 8.15 \text{ } \mu\text{M})\) in vitro.\(^{36,128}\) \((E,E)\)-5-Hydroxy-1,7-diphenyl-4,6-heptadien-3-one \((227)\), \((S)\)-1,7-diphenyl-6\((E)\)-hepten-3-ol \((228)\),
and alnustone (229) were isolated from A. katsumadai Hayata with significantly neuraminidase inhibitory in vitro with IC50 values between 1.0 and 6.1 μM. In addition, 229 also possessed antiemetic, antimycobacterial activities, and significantly inhibited proliferation of Bel 7402 and L0-2 cells. Investigation of A. katsumadai Hayata also led the isolation of...
compounds 230–238, 49, 119, 121, 123–125. 1,7-Bis(4-hydroxyphenyl)-1,4,6-heptatrien-3-one (239) and bisdemethoxycurcumin (240) were obtained from rhizomes of *A. galanga* (L.) Willd, both of which significantly inhibited the proliferation of melanoma cells and indistinctively inhibited cellular tyrosinase. 126 A planar structure of 1,7-diphenyl-5-hydroxy-6-hepten-3-one (241) was reported from *A. nutans* Rosc., 127 *A. rafflesiana* Wall.ex.Bak., 128 and *A. officinarum* Hance. 129 While its enantiomers, 5S (241a) and 5R (241b) counterparts, were identified from *A. mutica* Roxb. 130 and *A. katsumadai* Hayata, 131 respectively. It was shown that a large amount of diarylheptanoids (242–276) were obtained from the rhizomes of *A. officinarum* Hance. 27, 131–136 7-(3,4-Dihydroxyphenyl)-1-(4-hydroxy-3-methoxyphenyl)-4-en-3-heptanone (257) displayed moderate cytotoxicity against human tumor cell lines of HepG2, MCF-7, and SF-268. While (AE,6E)-5-hydroxy-1-(4-hydroxy-3-methoxyphenyl)-7-phenylhepta-4,6-dien-3-one (258) showed weak cytotoxicity against two cancer cell lines of MCF-7 and T98G with IC50 values of 22.68 and 4.44 μM, respectively. 135 Meanwhile, 258–267 were proved to be inhibitors of *Helicobacter pylori* (Hp-Sydney and Hp-F44). 129 AO-5 (263) showed anti-inflammatory activity induced by 12-O-tetradecanoylphorbol-13-acetate (TPA), platelet-activating factor (PAF), and NO. 110, 135, 136, 137 Moreover, it exhibited very weak cytotoxic activity against human glioblastoma T98G cells (IC50 = 27 μM). 138 The acetone extract of the rhizomes of *A. officinarum* Hance showed 5α-reductase inhibitory effect, which was superior to the drug used in the treatment of androgen-dependent disorders. Therefore, a bioactivity-guided isolation was performed and resulted in the isolation of 263–266 which exerted 5α-reductase inhibitory effect with IC50 values ranging from 220 to 390 μM, indicating potent usage in treating androgen-dependent diseases. 139 Besides, AO-1 (266) also showed anti-helicobacter pylori, hypolipidemic activities, and NO.

Fig. 5 Diarylheptanoids from *Alpinia* species (continued).
AO-2 (267) was identified as an inhibitor of prostaglandin (PG) biosynthesis and exerted antioxidant activity.\textsuperscript{130,131,141} It is interesting to note that dihydroyashabushiketol (264), AO-1 (266), and AO-2 (267) were firstly reported as planar structures, and later, their absolute configurations were established as 264a, 266a, and 267a, respectively.\textsuperscript{136,144} 7-(4'-Hydroxy-3''-methoxyphenyl)-1-phenyl-3,5-heptadione (268) also exhibited prostaglandin biosynthesis inhibitory effect.
with IC\textsubscript{50} values of 50 \textmu M.\textsuperscript{143} AO-4 (269) was found to have marked inhibitory effect on TPA-induced inflammation and antioxidant activity.\textsuperscript{142,144} 6-Hydroxy-1,7-diphenyl-4-en-3-heptanone (270) was a PAF inhibitor.\textsuperscript{137} AO-3 (271) and (5S)-3-methoxy-1,7-diphenyl-3-heptanone (272) displayed potent inhibitory effects on TPA-induced inflammation in mice with 50% of inhibition at a dose
of 0.8–2.7 μmol per ear.\textsuperscript{144} (3R,5R)-1-(4-Hydroxyphenyl)-7-phenyl-3,5-heptanediol (273) showed significantly antiemetic effect induced by CuSO\textsubscript{4} with 37.7% inhibition at a dose of 50 mg kg\textsuperscript{-1}.\textsuperscript{27,145}

Investigation on seeds of \textit{A. blepharocalyx} K. Schum. led to the isolation of ten cyclic diarylheptanoids (274–283).\textsuperscript{115,146–148} Rhizomes of \textit{A. officinarum} Hance provided 3,6-furan-7-(4′-
Fig. 7 Flavonoids from *Alpinia* species (continued).

Fig. 8 Phenolics from *Alpinia* species.
hydroxy-3''-methoxyphenyl)-1-phenylheptane (284). From the seeds of A. katsumadae, 285–292 were obtained,199 three of which (285–287) displayed weak antiproliferative activities against four cancer cell lines of NCI-H460, HeLa, SMMC-7721, and HCT-116 with IC50 values of 15.39–42.24 mM.115,149 A. blepharocalyx K. Schum. was the source of 293–305.115,138,139,151 However,
the stereochemistry at C-9 of six stereoisomers (294/295, 296/297, 298/299, 300/301, 302/303, 304/305) remained unsolved. Calyxin J (298), epicalyxin J (299), calyxin K (300), and epicalyxin K (301) showed marked anti-proliferative activity against human HT-1080 fibrosarcoma cells with ED50 values from 0.3–8.2 µM. Compounds 302–305 were proved to inhibit NO production in endotoxin-activated murine macrophages J774.1 with 90–94% inhibitory rate at a concentration of 100 µg mL⁻¹. Seeds of A. katsumadai Hayata provided 306–318. Calyxins Q (306) and R (307) exerted potent antiproliferative activities against four cancer cell lines of NCI-H460, HeLa, SMMC-7721, and HCT-116 at the level of IC50 values of 15.3–42.2 µM. Epicalyxin B (319) and epicalyxin B (320) were obtained from A. blepharocalyx K. Schum. and A. pinnanensis as NO production inhibitors. In addition, 319 showed potent anti-proliferative activity against human HT-1080 fibrosarcoma cells with an ED50 value of 0.69 µM. Both A. pinnanensis T. L. Wu et Senjen and A. katsumadai Hayata yielded alpinnanin B (321) and calyxin B (319) and epicalyxin B (320) were isolated. Epicalyxin H was identified as NO production inhibitor. Seeds of A. blepharocalyx yielded 324–330. It’s worth mentioning that all three structures of calyxin L (325), epicalyxin F (327), and calyxins F (328) in the Scifinder were wrong. Out of a serious of diarylheptanoids bearing a chalcone or a flavanone moiety, epicalyxins I (326), F (327), and calyxin F (328) were shown to possess strong anti-proliferative activities toward colon 26-L5 carcinoma and HT-1080 fibrosarcoma with IC50 values ranging from 0.5 to 10.1 µM. Meanwhile, 326 and 327 were cytotoxic against human fibrosarcoma cells with IC50 values ranging from 0.9 to 12.1 µM. 6-Hydroxycalyxin F (329) and calyxin A (330) demonstrated NO production inhibitory activities with IC50 values of 49 and 62 µM, respectively. Rhizomes of A. pinnanensis T. L. Wu et Senjen provided deoxycalyxin A (331), alpinnanins A (332), and C (333). In addition, 331 was also found in A. blepharocalyx K. Schum. While officinin A (334) was obtained from rhizomes of A. officinarum Hance.

Five dimeric diarylheptanoids (335–339) were obtained from rhizomes of A. officinarum Hance. Only alpinin C (338) displayed selective cytotoxic against MCF-7 (IC50 = 62.3 µM) and T98G cells (IC50 = 57.3 µM). Seeds of A. blepharocalyx K. Schum. provided 340–344 possessing two diarylheptanoid units and a chalcone moiety. Both blepharocalxins A (340) and B (341) showed concentration-dependent inhibition in the range of 1–100 µg mL⁻¹ against NO production in endotoxin-activated murine macrophages J774.1. Blepharocalxins C–E (342–344) were tested for antiproliferative activities against two tested cancer cells, blepharocalyxin D (343) exhibited the strongest effect against highly liver-metastatic murine colon 26-L5 carcinoma cells (ED50 = 3.6 µM), whereas blepharocalyxin E (344) showed the strongest activity against human HT-1080 fibrosarcoma cells (ED50 = 9.02 µM). It is worth mentioning that the stereochemistry at C-I-5 position for 343 in Scifinder was S, which was not correct and should be revised as R. Moreover, the two diarylheptanoid moieties in 344 were wrongly connected. Instead, it should be joined through C-I-6 and C-II-7. Two unusual diarylheptanoid derivatives, neoecalyxin A (345) and its epimer neoecalyxin B (346), were found from the seeds of A. blepharocalyx K. Schum., with the stereochemistry at C-9° undetermined.

Rhizomes of A. officinarum Hance produced officinaruminane B (347), a diarylheptanoid coupled with a monoterpene unit. Investigation on seeds of A. katsumadai Hayata identified two novel anti-emetic diarylheptanoids, katsumadains A (348) and B...
Besides, 348 also exerted promising neuraminidase inhibitory effect against human influenza virus A/PR/8/34 (IC50 = 1.05 μM). 4-Phenethyl-1,7-diphenyl-1-heptene-3,5-dione (350) was isolated from rhizomes of *A. officinarum* Hance. It exhibited weak antibacterial activity against Hp-Sydney and Hp-F44 with the MIC values of 23.6–31.4 and 78.5 μM, respectively.
Rhizomes of *A. officinarum* Hance yielded 354–358 containing a rare β-γ linkage. All five compounds exhibited weak antioxidant activities against the autoxidation of methyl linoleate in bulk phase.\textsuperscript{163} Extracts of seeds of *A. katsumadai* Hayata afforded antiemetic katsumadin (359) with antiemetic activity on *CuSO₄*-induced emesis in young quail.\textsuperscript{164} Galanganol B (360) was isolated from rhizomes of *A. galanga* (L.) Willd.\textsuperscript{165} Investigation on the whole plant of *A. conchigera* afforded eight rare 8-9 linked neolignans 361–368.\textsuperscript{165} Although congheranals D (364) and E (365) shared the same planar structure, their relative configurations were not be determined. Galanganal (366), galanganol A (367), and B (368) were also found from rhizomes of *A. galanga* (L.) Willd.\textsuperscript{166} Compounds 361–367 exhibited significant cytotoxic activity against cancer Hela cells with IC₅₀ values ranging from 1.5 to 5.29 μg mL⁻¹.\textsuperscript{167} Interestingly, 366 and 368 also inhibited NO production in mouse peritoneal macrophages.\textsuperscript{166} Galanganol C (369) was obtained from rhizomes of *A. galanga* (L.) Willd as a NO production inhibitor.\textsuperscript{166} The whole plant of *A. conchigera* yielded three unusual sesquileonignans, conghianals A–C (370–372) bearing a tetrahydropyrane ring.\textsuperscript{167} 7-Methoxycoumarin (373) is a coumarin known from *A. calcarata* Rose.\textsuperscript{168}

Citrusin B (374) and 2,3-dihydro-2-(4-β-D-glucopyranosyl-3-methoxyphenyl)-3-hydroxymethyl-7-hydroxy-5-benzofranpropanol (375) were the only two lignan glycosides isolated from leaves of *A. speciosa*.\textsuperscript{168}

5. Flavonoids

To date, 71 flavonoids (Fig. 7) were isolated from the *Alpinia* species, including seven flavones (376–382), 14 flavonols (383–396), four flavanones (397–400), seven flavanones (401–407), two dihydrochalcones (408 and 409), 13 chalcones (410–422), four flavanols (423–426), and 18 flavonoid glycosides (427–444), two flavonoid oligomers (445 and 446).

Tectochrysin (376) and chrysin (377) were isolated from *A. oxyphylla* Miq. and exhibited moderate anti-inflammatory activities against LPS-induced NO production in RAW264.7 macrophage cells.\textsuperscript{169} Both *A. bracteata* and *A. officinarum* Hance produced apigenin (378), which displayed moderate activity on scavenging DPPH free radicals (EC₅₀ = 90 ± 1.5 μM).\textsuperscript{170} *A. galanga* (L.) Willd was the source of 379–381 and *A. tonkinensis* Gaupnep. produced 5-hydroxy-3',4',7-trimethoxy flavanone (382).\textsuperscript{167,171} Kaempferol-3',4'-dimethylether (383) was afforded by *A. sachuanensis* Z. Y. Zhu.\textsuperscript{172} Galangin (384) and kaempferide (385) were the major flavonols distributed in several plants of *Alpinia*, both of which exhibited inhibitory against penicillinase and potent antioxidant activities.\textsuperscript{113,172} In addition, galangin effectively inhibited the TPA-induced invasion and migration of HepG2 cells at concentrations of 2.5–5 μM.\textsuperscript{173} In 2001, a review summarized anti-genotoxic activity of galangin and demonstrated that galangin was a promising candidate for cancer chemoprevention.\textsuperscript{174} Investigation on the whole plant of *A. sachuanensis* Z. Y. Zhu provided kaempferol (386).\textsuperscript{172} From *A. speciosa*, *A. galanga* (L.) Willd, *A. katsumadai* Hayata, and *A. tonkinensis* Gaupnep., 3-methoxykaempferol (387) was isolated.\textsuperscript{175–178} While *A. fiabellata* Ridley, *A. oxyphylla*, and *A.

4. Lignans

Twenty-four lignans (351–374) were reported from the genus of *Alpinia* (Fig. 6). Separation for leaves of *A. fiabellata* Ridley resulted in the isolation of 351–353, three phenylbutanoid dimers bearing a novel tetracyclic moiety.\textsuperscript{161,162} cis-1-{2,4,5-Trimesoxy-E-styryl}-2-{2,4,5-trimesoxy-Z-styryl}cyclobutane (351) and trans-1-{2,4,5-trimesoxy-E-styryl}-2-{2,4,5-trimesoxy-Z-styryl}cyclobutane (352) showed weak antibacterial against *Staphylococcus aureus* with MIC values of 5.0 and 2.5 mM, respectively.\textsuperscript{161} Furthermore, 351 significantly decreased the ovalbumin permeability in intestinal cells.\textsuperscript{161}
tonkinensis Gagnep. yielded 3,5-dihydroxy-7,4′-dimethoxyflavone (388), 115,161,171 Izaflpin (389) from different parts of A. oxyphylla Miq. was a NO production inhibitor and exhibited potent antioxidant activity. 113,176 From rhizomes of A. officinarum, 3-methylethelagalinganin (390) was identified as an inhibitor of pancreatic lipase with an IC50 value of 1.3 mg mL-1. 179 Compounds 391–395 were mainly obtained from A. tonkinensis Gagnep. 175 5-Hydroxy-3,7,4′-trimethoxyflavone (396) was yielded by leaves of A. flabellata Ridley. 180 Pinocembrin (397) and alpinetin (398) were distributed in several Alpinia species and both showed antiemic activities. 181,183 In addition, 397 also demonstrated several bioactivities, such as cytotoxicity (on human T4 lymphoblastoid cancer cells), 182 anti-inflammation, 183 and antiplatelet aggregation etc. 183 While, 398 was a PAF receptor binding inhibitor. 184 7,4′-Dihydroxy-5-methoxy flavone (399), pinostrobin (400) were reported from several species. 116, 118, 128, 186 Pinobanksin (401), (2R,3S)-pinobanksin-3-cinnamate (402), and 3-O-acetylinobanksin (403) were mainly obtained from A. galanga (L.) Willd. and A. katsumadai Hayata. 176, 177, 178 Compound 402 showed potent neuroprotective effect against PC12 cells. 177, 186 Leaves of A. flabellata Ridley provided 404 and 405. 189 Dihydrokaempferol (406) were isolated from A. oxyphylla. 189 Both A. japonica (Thunb.) Miq. and A. galanga (L.) Willd. were sources for alpinone (407). 177, 187 From seeds of A. katsumadai Hayata, a dihydrochalcone uvangolethin (408) was isolated. 189 A. speciosa K. Schum. and A. formosana afforded another dihydrochalcone, dihydroflavokinin B (409). 81, 188 Flavokinin B (410) was isolated from several plants and showed strong cytotoxicity against human T4 lymphoblastoid cancer cells (IC50 = 6.5 μM) and anti-inflammatory activity. 182, 189 Cardamomin (411) distributed in many Alpinia species 108, 118, 123, 148, 150 and exhibited extensive bioactivities including death receptor 5 (DR5) promoter, 175 antimicrobial, 191 antiemetic, 192 anti-coagulation, 183 and anti-inflammation. 198 Interestingly, it also protected septic mice from acute lung injury by preventing endothelial barrier dysfunction. 192 2′, 3′, 4′, 6′-Tetrahydroxylchalcone (412), which was obtained from A. rafflesiana Wall. ex. Bak., was potently active to DPPH free radical scavenging (IC50 = 55 μM). 128 Rhizomes of A. pricei Hayata yielded 2′, 4′, 6′-trimethoxychalcone (413) and pinostrobin chalcone (414). 199 Compounds 415–417 were isolated from the seeds of A. blepharocalyx K. Schum. 116, 117 while helichrysetin (415) was also found in A. katsumadai Hayata. 188 Pinocembrin chalone (418) and 4′, 6′-dimethylchalconaringenin (419) were provided by A. katsumadai Hayata and A. pinnanensis T. L. Wu et Senjen, respectively. 188, 192 Compound 418 was also isolated from A. platychilus. 193 Galanganes A–C (420–422) were three novel chalcones bearing a long-chain alkylphenol from A. galanga. 194, 198 Whilst A. katsumadai Hayata and A. zerumbet (Pers.) B. L. Burttet Smith. provided (+)-catechin (423). 195, 196 Epicatechin (424) and galloepicatechin (425) were yielded by A. oxymitra K. Schum. (+)-Epicatechin (426) was isolated from A. speciosa K. Schum. and displayed antioxidant activity. 197 Kaempferide-3-O-β-D-glucoside (427) from A. officinarum Hance had an weak inhibitory activity against penicillinase. 172 Study on A. speciosa K. Schum. lead to the isolation of 428–432. 198 Quercetin 3-O-robinobioside (433) and galangoflavononide (434) were obtained from A. katsumadai Hayata and A. galanga (L.) Swartz., respectively. 199, 200 Compounds 433–437 from A. densespicata Hayata exhibited moderate NO inhibitory activities. 201 Compounds 438–440 were obtained from the seeds of A. katsumadai Hayata and isorhamnetin-3-O-β-D-galactosyl-(6 → 1)-γ-C, rhamnoside (441) was isolated from rhizomes of A. tonkinensis Gagnep. 21, 196 Leaves of A. zerumbet (Pers.) B. L. Burttet Smith. contained rutin (442) and kaempferol-3-O-rutinoside (443). 195 The whole plant of A. sichuanensis Z. Y. Zhu yielded hesperidin (444). 22 Two pairs of enantiomers of flavonoidiglomer (445a and 445b, 446a and 446b) were found from rhizomes of A. platychilus. The compounds mixture of 446a and 446b showed anticoagulant activity on the prolongation of both prothrombin times (PT) and the thrombin times (TT) with a dose-effect relationship at 6.25–100 mM. 193

6. Phenolics

A total number of 66 phenolics (447–512) were obtained from Alpinia species (Fig. 8). [Di-(p-hydroxy-cis-styryl)methane (447) was obtained from A. galanga (L.) Willd. 200 Whilst alpinone (448) was isolated from A. gagnepainii K. Schum. with antibacterial effect against E. coli, B. subtilis, and S. aureus with the same MIC value of 12.5 μg mL-1. 191 (1E,4Z)-5-Hydroxy-1-phenylhexa-1,4-dien-3-one (449) and 2-propanol, 3-[4-(acetoxy)-3-methoxyphenyl] (450) were provided by A. katsumadai Hayata and A. galanga (L.) Willd, respectively. 86, 198 From A. sichuanensis and A. oxyphylla, dibutyl phthalate (451) was isolated. 21, 202 Two compounds named as (E)-p-coumaryl alcohol (452) and (E)-p-coumaryl alcohol γ-O-methyl ether (453) exhibited potent inhibitory activities against the autoxidation of methyl linoleate in bulk phase. 193 In addition, compound 453 exerted potent cytotoxic activity against the SNU638 cells with IC50 value of 1.62 μg mL-1. 202

A. galanga (L.) Willd and A. conchigera Griff. produced trans-p-hydroxyxincinnamaldehyde (454) and trans-p-hydroxycinnamyl acetate (455). 170, 203 Compound 454 displayed weak anti-allergic effect, 194 and NO production inhibitory activities (IC50 = 20 μM). 188 and 455 exerted no inhibitory activity towards Staphylococcus aureus strain VISA (MIC = 203 μM). 16, trans-p-Coumaryl alcohol (456) was a weak NO production inhibitor from A. galanga (L.) Willd (IC50 = 72 μM). 16 trans-p-Coumaryl diacetate (457) from A. galanga showed a number of bioactivities, including anti-allergy, 204 efflux pump inhibition, 205 NO production inhibition, 16, xanthine oxidase inhibition, 206 antileishmania, 164 cytotoxicity, 207 and antibacterias. 195 trans-p-Acetoxyxincinnamyl alcohol (458), trans-p-hydroxyxincinnamaldehyde acetate (459), and p-coumaric acid (460) were obtained from rhizomes of A. galanga (L.) Willd. 16, 205 In addition, compound 460 was also distributed in A. galanga (L.) Willd. 16, A. sichuanensis Z. Y. Zhu, 2, A. speciosa, 198 A. blepharocalyx K. Schum, 116, and A. oxyphylla. 199 Both A. formosana and A. speciosa K. Schum. were sources of methyl trans-cinnamate (461). 81, 188 Seeds of A. blepharocalyx yielded methyl p-hydroxyxincinnamate (462) and methyl p-hydroxycinnamyl ketone (463). 163 From rhizomes of A. galanga (L.) Willd, 12 compounds (464–475) were obtained. 13, 81, 203, 207 Among them, 15′-1′-acetoxychavicol acetate (464) and 1-acetoxyxugenol acetate (465) were the most
abundant phenylpropanoids presented in A. galanga (L.) Swartz, A. officinarum Hance, and A. conchigera Griff. They were reported to have anti-ulcer, antitumoral, and antitumor bioactivities. Furthermore, 464 also showed antiallergic, efflux pump inhibitory, NO production inhibitory, xanthine oxidase inhibitory, gastroprotective, anti-HIV, anti-cancer, anti-bacterial, plant growth-inhibitory and fungal growth-inhibitory activities. Two compounds, methylpentenol (466) and hydroxychavicol acetate (467), were isolated from A. galanga (L.) Wild. 468 It was demonstrated that 467, a chavicol acetate analogue, suppressed T-bet expression in Th cells. Besides, 467 also showed weak antibacterial activity against Staphylococcus aureus strain VISA (MIC = 0.8 mM). 469 trans-Coniferyl diacetate (468) was proved to be a xanthine oxidase inhibitor. Three new phenolics 469, 470, and 471, along with four known ones 472–475 were also yielded by A. galanga. 473,474,475 Chavicol acetate (476) and 1′-acetoxychavicol acetate (477) were two known phenolics found from A. conchigera Griff. 476 Compound 477 possessed antibacterial, 477 xanthine oxidase inhibitory, gastroprotective, and anti-cancer activities. 478 Investigation on leaves of A. flavissima Ridley provided 478–480, with strong antibacterial activities against Staphylococcus aureus. 481–483 Compounds 481–489 were nine phenolic acids isolated from several Alpinia species. Protocatechuic acid (489) showed potent neuroprotective effect on MPP⁺-induced neurotoxicity and H₂O₂-induced oxidative damage in PC12 cells. 486 In addition, it also exerted anti-aging effect on spleen and liver antioxidative system of senescent mice. 487 4-Hydroxybenzaldehyde (490), isolated from A. sibthorpioides Z. Y. Zhu, A. blepharocalyx K. Schum., A. bracteata, and A. galanga (L.) Wild, didn’t show any DPPH radical-scavenging activity. Instead, it exhibited inhibitory activity on xanthine oxidase (IC₅₀ = 19.6 μM). Compounds 491–496 were provided by several Alpinia plants.

Ethyl 4-O-feruloyl-β-glucopyranoside (497) and 4-hydroxy-3-methoxyphenyl 4-O-feruloyl-β-glucopyranoside (498) were two new glucoside esters of ferulic acid from rhizomes of A. speciosa, both of which showed antioxidant activities. Investigation on rhizomes of A. officinarum Hance yielded 499–506. While from rhizomes of A. bracteata, a new phenolic glycoside (507) was isolated and showed moderate antioxidant activity on scavenging DPPH free radicals (EC₅₀ = 169 ± 4.8 μM). Leaves of A. speciosa K. Schum. provided coniferin (508) and syringin (509). Dihydro-5,6-dehydrokawain (510) and 5,6-dehydrokawain (511) were major chemical constituents in several Alpinia species. They showed antitumoral, anti-thrombotic, antifungal, anti-obesity, and plant growth inhibitory activities. Recently, it was reported that they could strongly inhibit HIV-1 integrase with respective IC₅₀ values of 4.4 and 3.6 μg mL⁻¹. In addition, they exhibited mixed type of inhibition against neuraminidase with both IC₅₀ values of 25 μM. Furthermore, 511 was also reported as a slow and time-dependent reversible inhibitor of neuraminidase, a moderate antioxidant, a strong inhibitor of skin diseases-related enzymes, and strong antiplatelet inhibitor. Interestingly, a dimer of 5,6-dehydrokawain, AS-II (511a), was an artifact formed by photo-irradiation during the isolation procedure of A. speciosa K. Schum. leaves. 512 4-Hydroxy-5,6-dehydrokawain was an α-pyrone isolated from A. blepharocalyx K. Schum. It displayed antiproliferative activity against murine colon 26-L5 carcinoma and human HT-1080 fibrosarcoma with ED₅₀ 20.7 and 20.1 μM, respectively. It also showed inhibitory effect on platelet aggregation induced by collagen, arachidonic acid (AA), adenosine diphosphate, and ristocetin.

7. Steroids

Seven steroids (Fig. 9) were isolated from Alpinia species including four cholesates and three sitosterol glycosides. As it is the same in plants of the other genera, β-sitosterol and stigmasterol were also widely distributed in Alpinia species. β-Sitosterol-3-O-β-D-palmitooylglucoside showed potent antiangiogenic activity induced by CuSO₄.

8. Alkaloids

Officinarominane A (520) and officincine B (521), two alkaloids of bi-diarylheptanoid connecting by a pyridine ring were contributed by rhizomes of A. officinarum Hance. A study on seeds of A. katsamadai Hayata afforded another six alkaloids. Alkaloids from several species from 1955 to 2015 are presented in Fig. 9.

9. Stilbenes

Six stilbenes, 528–533, were all isolated from aerial parts of A. katsamadai Hayata.

10. Others

One esters and three fatty acids, 535–537, were isolated from several Alpinia species. (S)-2-Pentanol-2-O-β-D-glucopyranoside, which showed inhibitory effect on NO production from LPS-activated RAW264.7 macrophage cells, was obtained from fruits of A. oxyphylla. Two glycosides known as 3-methylbut-2-en-1-yl-β-D-glucopyranoside and n-butyl-β-D-fructopyranoside were isolated from A. officinarum Hance. While 541–544 were found in different Alpinia species (Fig. 9). Interestingly, 5-hydroxymethylfurural exerted memory improvement activity against Alzheimer’s disease by mitigating the degree of neuronal damage.

11. Conclusions

The number of publications on the chemical constituents and their bioactivities for Alpinia species from 1955 to 2015 are shown in Fig. 10. Before 1999, fewer investigations (less than five per year, except six in 1987) were performed on this genus. However, after 2009, there were more than 10 papers published for each year. In 2013, the number of published articles reached 26, indicating a growing interest in the genus of Alpinia. Till 2015, investigations on chemical constituents of the Alpinia species afforded a total of 544 compounds, including 207 terpenoids, 143 diarylheptanoids, 25 phenylpropanoids, 71
flavanones, 66 phenolics, seven steroids, eight alkaloids, six stilbenes, and 11 others (Fig. 11). Among 207 terpenoids, 17 are monoterpenoids, 132 are sesquiterpenoids, 57 are diterpenoids, and the rest one is a triterpenoid. For sesquiterpenoids, eudesmanes and eremophilanes are undoubtedly predominant with 44 and 21 components, respectively. While for diterpenoids, almost all are labdanes.

Amongst 544 isolated compounds from the genus of *Alpinia*, 247 are new ones (Table 1), including 96 diarylheptanoids and 106 terpenoids. Obviously, diarylheptanoids, especially diarylheptane–flavonoid conjugates, are characteristic components for the genus of *Alpinia*.245

The crude extracts of *Alpinia* species and their chemical constituents were found to possess various biological activities. Mainly reported were antiemetic,26,27 antibacterial,29–31,77,82,212–216 antioxidant,127,237–239 anticancer,32–34,240–247 anti-inflammatory,109,246,247 insecticidal,36,164 and neuroprotective bioactivities.36,39,231,248–250

In addition, they also showed antidiabetic,25 antiparkinsonian,217,183 hepatoprotective,215 and hypolipidemic effects.252 Meanwhile, evidences showed that ethanol extract of *A. galanga* can retard lipid oxidation for minced beef, indicating a great potential utility for food storage.2 What should be aroused considerable interest was the promising anticancer and hepatoprotective properties, which could be a great potential to be developed as herbal medicines.

Although there are about 230 species for the *Alpinia* genus, only 35 were investigated for their chemical constituents and bioactivities [Fig. 12], because *A. jiangenfeng* T. L. Wu includes *Alpinia sichuanensis* Z. Y. Zhu, and *A. zerumbet* (Pers.) B. L. Burtt & R. M. Sm. includes *A. speciosa* K. Schum. according to The Plant List. Among these species, *A. galanga*, *A. oxyphylla*, *A. officinarum*, and *A. katsumadai* are four most studied plants with referenced papers of 43, 40, 32, and 23, respectively. While for the rest of 31 species, only very fewer articles were published, most of which were less than five. As a matter of fact, there was even only one paper published for 18 species. Although this genus contributed a diverse array of bioactive compounds, the potential of *Alpinia* species remains virtually unappreciated. Thus, much attention should be paid to *Alpinia* species on further phytochemical and pharmacological studies, which would produce structurally interesting and biologically active compounds with potential use in agricultural and medicinal applications. In addition, although most of *Alpinia* species were also used as edible plants, the nutritious components and their effects were seldom investigated, which could be a hotspot in the near future.
