#### Abstract

A base-mediated, three-component synthesis of symmetric and unsymmetric pyran-fused biscoumarins via the coupling of 4-hydroxycoumarin with 4-chloro-3-formylcoumarin in ethanol is reported. This methodology is further extended to the construction of various indole/coumarin-substituted symmetric pyran-fused biscoumarins. The unsymmetric pyran-fused biscoumarin can react with amines and 4hydroxycoumarins under basic and acidic conditions to afford pyridinone-fused coumarins and pyranone-fused coumarins, respectively. The mechanisms of their formation are proposed.

## 1 Introduction

Coumarin-fused heterocycles are a class of organic compounds that combine the fused-ring structure of coumarins with one or more heterocyclic rings. The fusion of coumarins with heterocycles can result in molecules with a diverse range of biological activities. For instance, the pyran-fused biscoumarin 1 belongs to the class of nonpeptidic HIV protease inhibitors. ${ }^{1}$ Pyridinone coumarin conjugate 2 a is an adenosine receptor, ${ }^{2 a}$ and pyridinone coumarin conjugate $2 \mathbf{2 b}$ exhibits mild anti-microbial activity against both Gram positive and negative bacteria. ${ }^{2 b}$ Frutinone A (3) is an active ingredient extracted from the lipophilic fraction of the Polygala fruticosa, demonstrating various anti-fungal properties. ${ }^{3}$ Pyranone coumarin conjugate 4 exhibits good anti-fungal activity against $B$. cinerea and $C$. capsica (Fig. 1). ${ }^{4}$

In addition to their biological activities, coumarin-fused heterocycles also have a wide range of potential applications in organic functional materials. For example, pyranocoumarin 5 possesses photochromic properties. ${ }^{5}$ Pyrrolocoumarin 6 serves as a light-sensitive organic redox switch. ${ }^{6}$ Pyrrolocoumarin 7 is electrochromic and changes color when an external potential is applied (Fig. 2). ${ }^{7}$

Owing to their potential as therapeutic agents and functional materials, the synthesis of coumarin-fused heterocycles has become an active area of research. While various methodologies

[^0]for the preparation of pyranocoumarin derivatives have been reported in the literature, ${ }^{8}$ the development of multicomponent synthesis of these compounds from readily available precursors is still needed to facilitate the progress of unearthing their unprecedented properties. Here we report the three-component synthesis of two isomeric pyran-fused biscoumarins via base-promoted reaction of 4-hydroxycoumarin with 4 -chloro-formylcoumarin in ethanol. Subsequent investigation of their chemical reactivity toward nucleophilic reagents such as amines and 4-hydroxycoumarins under acidic and basic conditions are also explored.

## 2 Results and discussion

We began our study by coupling of 4-hydroxycoumarin (8) with 4 -chloro-formylcoumarin (9) in the presence of triethylamine as

a base in ethanol under room temperature for 24 hours to give compound 10 in $30 \%$ yield as a minor product and compound 11 in $45 \%$ as a major product, as shown in Scheme 1. The structures of isomeric pyran-fused biscoumarins 10 and 11 could be easily differentiated by their proton NMR spectra. The characteristic singlet absorption peak that appeared at a chemical shift of 5.59 ppm was assigned to the pyran hydrogen for the biscoumarin 10, whereas the singlet absorption peak that appeared at a more downfield shift of 6.53 ppm was assigned to the acetal hydrogen for the biscoumarin 11. The molecular structures of both $\mathbf{1 0}$ and $\mathbf{1 1}$ were further unambiguously characterized by the X-ray crystallography as shown in Scheme $1 .{ }^{9}$

Table 1 summarizes the optimization for the regioselective preparation of the biscoumarins $\mathbf{1 0}$ and $\mathbf{1 1}$ in ethanol at room temperature. When an organic base such as triethylamine was employed, as shown in Scheme 1, a mixture of both isomers 10 and 11 were received (Table 1, entry 1). Interestingly, when DABCO was used as a base, the biscoumarin 10 was obtained as an exclusive product in $35 \%$ and $50 \%$ yields for 12 and 24 h , respectively (Table 1, entries 2 and 3 ). On the other hand, biscoumarin 11 was obtained as the major product even though in low yields when $\mathrm{K}_{2} \mathrm{CO}_{3}$ or $\mathrm{Na}_{2} \mathrm{CO}_{3}$ was employed as the inorganic base (Table 1, entries 4 and 5). When $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ was used as a base, to our delight, we observed the selective formation of 11 in $43 \%$ for 12 h at room temperature (Table 1, entry 6). Prolonged reaction time from 12 h to 24 h increased the yield of biscoumarin 11 from $43 \%$ to $72 \%$, along with only about $5 \%$ of biscoumarin 10 (Table 1, entry 7).

Scheme 2 outlines the proposed mechanism for the formation of biscoumarins $\mathbf{1 0}$ and $\mathbf{1 1}$ via this three-component reaction. ${ }^{10}$ In Path A, it presumably starts with 1,2 -addition of 4hydroxycoumarin (8) with 4 -chloro-formylcoumarin (9) to give

Scheme 1 Three-component synthesis of isomeric biscoumarins 10 and 11, and ORTEP crystal structures of 10 and 11 with atomic displacement shown at 50\% probability.

${ }^{a}$ Reaction conditions: 8 ( $0.31 \mathrm{mmol}, 1.0$ equiv.), 9 ( $0.31 \mathrm{mmol}, 1.0$ equiv.), base ( $0.32 \mathrm{mmol}, 1.0$ equiv.), ethanol ( 2.5 mL ) at rt .
the alcohol $\mathbf{A}$, and follows by cyclization to generate the intermediate $\mathbf{B}$. The subsequent aromatization of $\mathbf{B}$ via elimination of chloride ion and $\mathrm{H}_{2} \mathrm{O}$ yields the biscoumarin-fused pyrylium ion $\mathbf{C}$. Final 1,4-addition of ethanol to $\mathbf{C}$ affords the biscoumarin 10. In Path $B$, the reaction begins with preferential 1,4 -addition of 4-hydroxycoumarin (8) with 4-chloro-formylcoumarin (9) in the presence of $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ to give the aldehyde $\mathbf{D}$, and follows by cyclization to furnish the hemiacetal $\mathbf{E}$. The subsequent elimination of chloride ion and $\mathrm{H}_{2} \mathrm{O}$ of $\mathbf{E}$ yields the biscoumarinfused pyrylium ion $\mathbf{F}$. Final 1,2-addition of ethanol to $\mathbf{F}$ furnishes the biscoumarin 11.

With biscoumarins 10 and 11 in hand, we then investigated their chemical reactivity toward some common nucleophilic agents. When biscoumarin 10 was reacted with 4 -hydroxycoumarin in the presence of triethylamine as a base in toluene under reflux conditions for 24 h , the coumarin-substituted pyran-fused biscoumarin 12a was obtained in $68 \%$ yield (Scheme 3). Later, we found that this 12a could also be prepared under the same reaction conditions via a pseudo threecomponent reaction of two equivalents of 4 -hydroxycoumairn with 4-chloro-formylcoumarin (9) in $78 \%$ yield. Scheme 4 lists the structures and yields of the prepared pyran-fused biscoumarins 12a-e. ${ }^{11}$ In addition to 4-chloro-3-formylcoumarin (9), 3-chloro-3-phenylacrylaldehyde could also serve as a valid

Scheme 2 Proposed mechanism for the formation of compounds 10 and 11.

Scheme 3 Synthesis of pyran-fused biscoumarin 12a.
substrate to give the corresponding products 12c and 12e in good yields. The molecular structures of compounds 12 a and 12d were further confirmed by the X-ray crystal analysis as shown in Scheme $4 .{ }^{9}$ While it has been previously documented that compound 12a can also be synthesized via the same two substrates under acidic conditions in aqueous media, ${ }^{11 b}$ here we provide alternate basic conditions for its preparation and further extend the substrate scope from 4-chloro-3formylcoumarin to 3-chloro-3-phenylacrylaldehyde derivatives.

In an effort to expand the scope of this reaction from a pseudo three-component reaction to a three-component one, indole (13) was introduced as a third substrate for this potential multi-component reaction (MCR). To our delight, the biscoumarin 14a was obtained via triethylamine-mediated MCR of 4hydroxycoumairn (8), 4-chloro-3-formyl-7-methoxycoumarin (9a) and indole (13) in $71 \%$ yield. Scheme 5 lists the structures and yields of the prepared pyran-fused biscoumarins 14ad along with the X-ray crystal structure of compound $\mathbf{1 4 b} .{ }^{9}$ The formation mechanism of this MCR product presumably follows the reaction steps outlined in Scheme 2, except that the final pyrylium ion is captured by indole instead of ethanol, giving the product 14.

Interestingly, when biscoumarin 11 was reacted with amines (15) under the same conditions as the preparation of compounds 12, the novel pyridinone-fused coumarins 16 were isolated in fair to excellent yields (Scheme 6). On the proton NMR spectra, intramolecular hydrogen bonding absorption peaks appearing at $11.87-11.75 \mathrm{ppm}$ and singlet pyridinone

hydrogen absorption peaks appearing at $9.02-8.77 \mathrm{ppm}$ were observed for all prepared compounds 16. Scheme 6 lists the structures and yields of the prepared pyridinone-fused coumarins 16a-e along with the X-ray crystal structure of $16 e .{ }^{9}$ While both aniline and benzylamine could serve as valid nucleophilic agents to react with compound 11, the yield of the former was found to be much better than that of the latter.

Scheme 7 outlines the proposed mechanism for the formation of 16a from 11 and aniline. It begins with the elimination of ethoxide ion from $\mathbf{1 1}$ to form the pyrylium ion $\mathbf{G}$. The 1,2addition of aniline nitrogen onto the pyrylium ion $\mathbf{G}$ yields the pyranoamine $\mathbf{H}$, which then undergoes ring opening to give the imine $\mathbf{I}$. The subsequent enol-keto tautomerization of the imine I generates the keto $\mathbf{J}$. The $[1,5]$ shift of $\mathbf{C}-3$ hydrogen on coumarin to the imine nitrogen of $\mathbf{J}$ furnishes the enamine $\mathbf{K}$. Final intramolecular lactamization of $K$ affords the product 16a. Note that formation of proposed intermediate I appeared to be favored when aniline was used as the nucleophile, presumably due to the favorable extended conjugation. This may explain why using aniline as the nucleophile in this reaction gives better yields than benzylamine.

$16 e$

Scheme 6 Preparation of pyridinone-fused coumarins 16a-e, and the X-ray crystal structure of $16 e$.

Scheme 7 Proposed mechanism for the formation of compound 16a

On the other hand, when compound 11 was reacted with 4hydroxycoumarin (8) and 7-N,N-dimethylamino-4hydroxycoumarin (8a) in the presence of one equivalent of camphorsulfonic acid in wet acetonitrile under reflux conditions for 8 h , the major products isolated were found to be the benzopyrano[3,2-c]coumarin-linked pyranone-fused coumarins $\mathbf{1 7 a}$ and 17b, respectively (Scheme 8). The characteristic singlet absorption peaks for pyranone hydrogens of $\mathbf{1 7 a}$ and $\mathbf{1 7 b}$ that appeared at chemical shifts of 8.76 and 8.68 ppm were clearly observed on the proton NMR spectra. The molecular structure of the pyranone-fused coumarin 17 a was further confirmed by the X-ray crystallography as shown in Scheme $8 .{ }^{9}$

Scheme 9 depicts the proposed mechanism for the formation of 17 a from 11 and 8 . It begins with protonation of acetal oxygen of $\mathbf{1 1}$ to give the oxonium ion $\mathbf{L}$. The elimination of ethanol from $\mathbf{L}$ yields the pyrylium salt $\mathbf{M}$. The subsequent nucleophilic attack of 4-hydroxycoumarin to the oxonium carbon of $\mathbf{M}$ generates the pyran $\mathbf{N}$. The electrocyclic reaction to open up the pyran ring of $\mathbf{N}$ furnishes the $\alpha, \beta$-unsaturated keto $\mathbf{P}$, which is subjected to the conjugate addition by $\mathrm{H}_{2} \mathrm{O}$ to give the alcohol $\mathbf{Q}$. Final intramolecular cyclization of $\mathbf{Q}$ via elimination of one molecule of $\mathrm{H}_{2} \mathrm{O}$ affords the compound 17a. This reaction provides quick access to compounds with the linkage of two biologically active molecular scaffolds; that is, benzo-pyrano[3,2-c]coumarin and pyranone-fused coumarin. Since hybridization of two potent pharmacophores into a single molecule is one of the current strategies to synthesize compounds with improved pharmacological activity, ${ }^{12}$ the discovery of biological activity from these readily available coumarin-fused heterocycles is highly anticipated.

## 3 Conclusions

In summary, we have developed a base-mediated, threecomponent reaction for the construction of symmetric and unsymmetric pyran-fused biscoumarins via the coupling of 4hydroxycoumarin with 4 -chloro-3-formylcoumarin in ethanol. The symmetric and unsymmetric pyran-fused biscoumarins could serve as precursors to react with different nucleophilic agents including 4-hydroxycoumarins, indoles, and amines to afford products such as substituted biscoumarins, pyridinonefused coumarins, and pyranone-fused coumarins. The biological activities of those prepared compounds are currently under investigation.

## 4 Experimental section

### 4.1. General information

Melting points were determined on a Mel-Temp melting point apparatus in open capillaries and are uncorrected. Infrared (IR) spectra were recorded using 1725XFT-IR spectrophotometer. High resolution mass spectra (HRMS) were obtained on a Thermo Fisher Scientific Finnigan MAT95XL spectrometer using magnetic sector analyzer. ${ }^{1} \mathrm{H}$ NMR ( 400 MHz ) and ${ }^{13} \mathrm{C}$ NMR (100) spectra were recorded on a Bruker 400 spectrometer. Chemical shifts were reported in parts per million on the scale relative to an internal standard (tetramethylsilane, or appropriate solvent peaks) with coupling constants given in hertz. ${ }^{1} \mathrm{H}$ NMR multiplicity data are denoted by $s$ (singlet), d (doublet), t (triplet), q (quartet), m (multiplet). Analytical thin-layer chromatography (TLC) was carried out on Merck silica gel 60G-254 plates ( 25 mm ) and developed with the solvents mentioned. Visualization was accomplished by using portable UV light, ninhydrin spray, or iodine chamber. Flash chromatography was performed in columns of various diameters with Merck silica gel (230-400 mesh ASTM 9385 kieselgel 60H) by elution with the solvent systems. Solvents, unless otherwise specified, were reagent grade and distilled once prior to use. All new compounds exhibited satisfactory spectroscopic and analytical data.

### 4.2. Procedure for preparation of compound 10

To a 10 mL round bottom flask equipped with a magnetic stirrer was charged with 4 -hydroxycoumarin ( $8,0.31 \mathrm{mmol}, 1.0$ equiv.), 4-chloro-3-formylcoumarin ( $9,0.31 \mathrm{mmol}, 1.0$ equiv.) and DABCO ( $0.32 \mathrm{mmol}, 1.0$ equiv.) in ethanol ( 2.5 mL ) at room temperature. The resulting mixture was then stirred at that temperature for 24 h . Upon completion of the reaction (monitored by TLC) and the solvent was concentrated under reduced pressure. The residue was purified by column chromatography with ethyl acetate and hexane as the eluent to afford a pale yellow solid of compound $10(56 \mathrm{mg}$; yield $50 \%) . R_{\mathrm{f}}=0.4(2 \%$ $\mathrm{MeOH} / \mathrm{DCM}) ; \mathrm{mp} 231-233{ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta 8.07$ (d, $J=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.68(\mathrm{t}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.47-7.43(\mathrm{~m}, 4 \mathrm{H})$, $5.57(\mathrm{~s}, 1 \mathrm{H}), 4.27(\mathrm{q}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 1.20(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ $\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 161.1,155.0,152.9,133.5,124.9$, 122.7, 117.4, 113.5, 105.1, 70.4, 62.1, 15.9; IR $\nu_{\text {max }}$ (neat): 2924, 1727, 1713, 1670, 1610, 1398, 1192, 1059, 1044, 889, $759 \mathrm{~cm}^{-1}$; HRMS (EI) m/z: [M] calcd for $\mathrm{C}_{21} \mathrm{H}_{14} \mathrm{O}_{6}$ 362.0790; found 362.0801 .

### 4.3. Procedure for preparation of compound 11

To a 10 mL round bottom flask equipped with a magnetic stirrer was charged with 4 -hydroxycoumarin ( $8,0.31 \mathrm{mmol}, 1.0$ equiv.), 4-chloro-3-formylcoumarin ( $9,0.31 \mathrm{mmol}, 1.0$ equiv.) and $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ ( $0.32 \mathrm{mmol}, 1.0$ equiv.) in ethanol ( 2.5 mL ) at room temperature. The resulting mixture was then stirred at that temperature for 24 h . Upon completion of the reaction (monitored by TLC) and the solvent was concentrated under reduced pressure. The residue was purified by column chromatography with ethyl acetate and hexane as the eluent to afford a pale yellow solid of compound 11 ( 81 mg ; yield $72 \%$ ). $R_{\mathrm{f}}=0.6(2 \%$ $\mathrm{MeOH} / \mathrm{DCM}$ ); 51 mg ; yield $46 \%$; mp 194-196 ${ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta 8.05(\mathrm{dd}, J=7.6,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 8.02(\mathrm{dd}, J=$ $8.4,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.71(\mathrm{td}, J=8.4,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.57(\mathrm{td}, J=8.4$, $1.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.46-7.38(\mathrm{~m}, 3 \mathrm{H}), 7.30(\mathrm{td}, J=8.4,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.55$ (s, 1H), 4.04-3.91 (m, 2H), $1.23(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 164.1,158.9,158.8,154.1,153.8,139.6$, $134.6,132.5,128.8,124.9,123.9,123.8,117.3,117.1,115.2$, 114.9, 114.4, 101.2, 96.5, 66.3, 15.2; IR $\nu_{\max }$ (neat): 2990, 1709, 1608, 1533, 1453, 1403, 1061, 1036, 913, 862, $748,737 \mathrm{~cm}^{-1}$; HRMS (EI) m/z: [M] calcd for $\mathrm{C}_{21} \mathrm{H}_{14} \mathrm{O}_{6}$ 362.0790; found 362.0796.

### 4.4. Procedure for preparation of compound 12a via twocomponent reaction

To a stirred solution of 4-hydroxycoumarins ( $8,0.27 \mathrm{mmol}, 1.0$ equiv.) and 7 -ethoxy- $6 H, 7 H, 8 H$-pyrano[3,2-c:5,6-c']dichromene-6,8-dione ( $\mathbf{1 0}, 0.27 \mathrm{mmol}, 1.0$ equiv.) in toluene was added triethylamine ( $0.13 \mathrm{mmol}, 0.5$ equiv.) dropwise at room temperature. The resulting mixture was then heated to reflux for 24 h . Upon completion of the reaction (monitored by TLC), the reaction mixture was cooled to room temperature. The resulting solid was filtered and washed with hexanes and diethyl ether ( $5 \mathrm{~mL} \times 3$ times each), and the solid was dried under vacuum to get the desired product.

### 4.5. General procedure for preparation of compound 12a-e via pseudo-3-component reaction

To a stirred solution of 4-hydroxycoumarins ( $8,0.48 \mathrm{mmol}, 2.0$ equiv.) and 4 -chloro-3-formylcoumarins or 3-chloro-3phenylacrylaldehyde ( $0.24 \mathrm{mmol}, 1.0$ equiv.) in toluene was added triethylamine ( $0.12 \mathrm{mmol}, 0.5$ equiv.) dropwise at room temperature. The resulting mixture was then heated to reflux for 16 h . Upon completion of the reaction (monitored by TLC), the reaction mixture was cooled to room temperature. The resulting solid was filtered and washed with hexanes and diethyl ether ( $5 \mathrm{~mL} \times 3$ times each), and the solid was dried under vacuum to get the desired product.

### 4.6. General procedure for preparation of compounds 14ad via three-component reaction

To a stirred solution of 4-hydroxycoumarin ( $8,0.31 \mathrm{mmol}, 1.0$ equiv.), and 7 -methoxy-4-chloro-3-formylcoumarin or 3-chloro-3-phenylacrylaldehyde ( $0.31 \mathrm{mmol}, 1.0$ equiv.) in toluene was added indole (13a, $0.31 \mathrm{mmol}, 1.0$ equiv.) followed by triethylamine ( $0.15 \mathrm{mmol}, 0.5$ equiv.) dropwise at room temperature. The resulting mixture was then heated to reflux for 16 h . Upon completion of the reaction (monitored by TLC), the reaction mixture was cooled to room temperature. The resulting solid was filtered and washed with hexanes and diethyl ether ( $5 \mathrm{~mL} \times$ 3 times each), and the solid was dried under vacuum to get the desired product.
4.6.1 7-(1H-Indol-3-yl)-3-methoxy-6H-pyrano[3,2-c:5,6-c'] dichromene-6,8( $\mathbf{7 H}$ )-dione (14a). $R_{\mathrm{f}}=0.3\left(5 \% \mathrm{MeOH} / \mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$; off-white solid; 102 mg ; yield $71 \%$; $\mathrm{mp}>300{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR (DMSO- $\left.d_{6}, 400 \mathrm{MHz}\right): \delta 11.06(\mathrm{~s}, 1 \mathrm{H}), 8.36(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H})$, $8.26(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.72(\mathrm{t}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.51(\mathrm{t}, J=7.6 \mathrm{~Hz}$, $1 \mathrm{H}), 7.44-7.41(\mathrm{~m}, 2 \mathrm{H}), 7.32-7.30(\mathrm{~m}, 2 \mathrm{H}), 7.07-6.99(\mathrm{~m}, 3 \mathrm{H})$, $6.90(\mathrm{t}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 5.10(\mathrm{~s}, 1 \mathrm{H}), 3.87(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}$ ( 100 MHz, DMSO- $d_{6}$ ): $\delta 161.6,160.1$ (3C), 155.2, 152.8, 152.4 (2C), 133.5 (3C), 132.8, $125.4(3 \mathrm{H}), 124.4,123.6(3 \mathrm{H}), 117.0(3 \mathrm{H})$, 116.7, 113.5 (3H), 102.9, 25.8; IR $\nu_{\max }(\mathrm{KBr}): 3412,2950,2912$, 1731, 1665, 1615, 1371, 1267, 1171, 1150, 1050, $735 \mathrm{~cm}^{-1}$; HRMS (EI) $\mathrm{m} / \mathrm{z}:[\mathrm{M}]^{+}$calcd for $\mathrm{C}_{28} \mathrm{H}_{17} \mathrm{NO}_{6} 463.1056$; found 463.1051.

### 4.8. General procedure for preparation of compounds $17 a$ and 17b

To a 10 mL round bottom flask equipped with a magnetic stirrer and a reflux condenser was charged with $11(0.14 \mathrm{mmol}, 1.0$ equiv.), 4-hydroxycoumarins ( $0.14 \mathrm{mmol}, 1.0$ equiv.) and camphorsulfonic acid ( $0.14 \mathrm{mmol}, 1.0$ equiv.) in acetonitrile (3.0 mL ) at room temperature. The resulting reaction mixture was heated at $80{ }^{\circ} \mathrm{C}$ in an oil bath for 8 h . Upon completion of the reaction (monitored by TLC), the reaction mixture was cooled to room temperature, and the solvent was concentrated under
reduced pressure. The residue was purified by column chromatography using ethyl acetate and hexane as the eluent to give the desired products.
4.8.1 3-(7-Hydroxy-6-oxo-6H,7H-chromeno[4,3-b]chromen-7-yl)-2H,5H-pyrano[3,2-c]chromene-2,5-dione (17a). $R_{\mathrm{f}}=0.5$ ( $40 \%$ EtOAc/hexanes); off-white solid; 32 mg ; yield $48 \%$; mp $217-219{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta 8.76(\mathrm{~s}, 1 \mathrm{H}), 8.21(\mathrm{~d}, J$ $=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.88(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.66(\mathrm{t}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H})$, $7.51-7.32(\mathrm{~m}, 7 \mathrm{H}), 7.24(\mathrm{t}, J=6.8 \mathrm{~Hz}, 1 \mathrm{H}), 5.40(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 162.7,161.3,159.2,157.4,157.3$, 153.6, 153.0, 148.8, 135.4, 134.6, 133.3, 132.0, 130.2, 127.7, 125.9, 125.3, 125.0, 124.0, 123.5, 122.2, 117.6, 117.1, 116.8, 114.1, 113.0, 103.8, 100.8, 67.0; IR $\nu_{\text {max }}$ (neat): 2926, 2854, 1729, 1636, 1563, 1392, 1050, $754 \mathrm{~cm}^{-1}$; HRMS (EI) $\mathrm{m} / \mathrm{z}:[\mathrm{M}]^{+}$calcd for $\mathrm{C}_{28} \mathrm{H}_{14} \mathrm{O}_{8} 478.0689$; found 478.0686 .

## Conflicts of interest

There are no conflicts to declare.

## Acknowledgements

We thank the National Science and Technology Council of Taiwan, for financially supporting this research under Contract No. NSTC 112-2113-M-029-005-MY3, NSTC 109-2113-M-029-010MY3. Also, the support of the X-ray, MASS, and NMR measurements from The Instrument Center of National Chung Hsing University is greatly acknowledged.
