 Correction for 'Structural characterization of gas-phase cysteine and cysteine methyl ester complexes with zinc and cadmium dications by infrared multiple photon dissociation spectroscopy' by Rebecca A. Coates et al., *Phys. Chem. Chem. Phys.*, 2015, **17**, 25799–25808.

Although the overall conclusions of the original article remain unaffected (no experimental or theoretical IR spectra are changed, nor is any calculated thermochemistry at 0 K), the thermal corrections to the Gibbs free energy at 298 K were mistakenly overestimated. Corrected 298 K values for Tables 1 and 2 from the original manuscript are given below. Notably, only very subtle changes are found such that the relative order of all 298 K theoretically determined low-energy species remains the same for the  $[\text{Zn}(\text{Cys-H})]^+$ ,  $[\text{Cd}(\text{Cys-H})]^+$ ,  $[\text{Zn}(\text{CysOMe-H})]^+$ ,  $[\text{Cd}(\text{CysOMe-H})]^+$  and  $\text{CdCl}^+(\text{CysOMe})$  systems. Therefore, we have not corrected the relative energies used throughout the text.

**Table 1** B3LYP,<sup>a</sup> B3P86, and MP2(full) relative free energies (kJ mol<sup>−1</sup>) at 298 K of low-lying conformers of  $[\text{M}(\text{Cys-H})]^+$  and  $[\text{M}(\text{CysOMe-H})]^+$ <sup>b</sup>

Complex	Structure	Zn	Cd
