Acid-promoted cyclization of 2,4-diaryl-1,1,1-trifluorobut-3-en-2-oles and their TMS-ethers into CF₃-indenes†

2,4-Diaryl-1,1,1-trifluorobut-3-en-2-oles and their TMS-ethers in H₂SO₄ at room temperature in just 2 min are quantitatively cyclized into 1-aryl-3-trifluoromethyl-1*H*-indenes. The reaction proceeds through an intermediate formation of the corresponding CF₃-allyl cations, which are cyclized regioselectively at the allyl carbon atom most remote from the CF₃-group. The obtained CF₃-indenes in solution of EtOAc in the presence of silica gel at room temperature over 4 h are quantitatively isomerized into 3-aryl-1-trifluoromethyl-1*H*-indenes.

Introduction

Allyl alcohols are valuable synthons in organic chemistry. Recently we have shown^{1–3} that reactions of some trifluoromethyl substituted allyl alcohols with arenes under the action of Brønsted or Lewis acids have resulted in the formation of trifluoromethylated alkenes, indanes, or indenes. Synthesis of indenes^{4–6} is an actual goal in chemistry, biology, and medicine. For instance, indene derivatives are widely used as biologically active compounds,^{7,8} and ligands for metallo-complexes.^{9–12} Introduction of a trifluoromethyl group into the indene core may confer new chemical, biological (lipophilicity and bioavailability), and physical properties to the molecules, due to the strong electron acceptor characteristic of the CF₃ group. CF₃-indenes are rather rare compounds, and there are just a few reports on their synthesis.^{13–17} For instance, Langlois *et al.* showed just one example of BF₃-promoted cyclization of CF₃-allyl alcohol into the corresponding CF₃-indene.¹³

The main goal of this work was a study of acid-promoted electrophilic transformation of 2,4-diaryl-1,1,1-trifluorobut-3-en-2-oles **2** and their TMS-ethers **1**. CF₃-TMS-ethers **1** are easily available from chalcones by trifluoromethylation of the carbonyl group with CF₃TMS followed by desilylation with SnCl₂ or aqueous HCl leading to CF₃-allyl alcohols **2** (Scheme 1).

Results and discussion

First, we decided to study plausible reaction cationic intermediates by means of quantum chemical calculations. One would expect that compounds **1/2** under the action of Brønsted or Lewis acids could give rise to the corresponding CF₃-allyl cations.¹³ To estimate electronic characteristics of these cations we carried out DFT calculations of species **A** generated from **1a/2a** by the protonation of the OX group (X = TMS or H), followed by elimination of HOX (Fig. 1). The following parameters were calculated: *E* – energy of the HOMO and LUMO, global electrophilicity index ω ,^{18,19} natural charges *q*, contribution of the atomic orbital to the molecular orbital *k*. The calculation shows that carbon C² bears a large negative charge $-0.21e$, but carbon C⁴ has a small positive charge and gives rather big contribution (19.6%) to the LUMO. These data demonstrate that the reactive electrophilic center of cation **A** should be carbon C⁴ by both charge and orbital control. Species **A** possesses a big value of ω index 7.0 eV, pointing out its high electrophilicity.

Then we carried out reactions of the series of compounds **1/2** under the action of various acidic reagents (Table 1). Indeed, the cyclization of **1/2** into CF₃-indenes **3** takes place showing that carbon C⁴ is a reactive center in the corresponding intermediate cations **A**. Among all other tested Brønsted and Lewis acids, sulfuric acid (H₂SO₄) was found to be one of the best for this transformation, and the reaction in this acid took just 2 min (Table 1). Alcohol **2a** was not converted into acetic acid (room temperature, 4 h), and remained unreacted. On the other hand, strong Lewis acids AlX₃ (X = Cl, Br) in the reaction with **2a** led to complex oligomeric mixtures. The same reaction in trifluoroacetic needed a longer time

^a Isolated yields. ^b Yield obtained with the reaction in CF₃CO₂H (50 equiv.), instead of H₂SO₄, for 5 min. ^c Two regioisomers **3j1** and **3j2** with a ratio 1.25 : 1 and 96% yield were obtained. ^d The mixture of isomeric indenenes **3q** and **4q** in a ratio of 8 : 1, respectively, was obtained (see Scheme 2).

(room temperature, 1 h) and gave **3a** in 88% yield. Triflic acid CF₃SO₃H (TfOH) may be used as well; indene **3a** was formed in 2–3 min in 82% yield in this acid. However, we finally chose H₂SO₄ because it is a cheap and easy to handle reagent.

Both CF₃-TMS-ethers **1** and CF₃-allyl alcohols **2** gave the same indenenes with the same high yields (Table 1). In most of the cases, the formation of indenenes **3a–q** was quantitative (Table 1). However, in H₂SO₄ compounds **3h** and **3i** bearing donating methoxy groups were formed in low yields of 10 and 20%, respectively, due to the consequent transformations of these electron-rich indenenes in H₂SO₄. The use of less acidic CF₃CO₂H resulted in much higher yields of **3h** and **3i**, 92 and 50%, respectively (entries 8 and 9).

It should be noted that starting compounds **1/2**, bearing both electron withdrawing and donating substituents R¹, R² in aryl rings Ar¹, Ar², respectively, led to the exclusive formation of indenenes **3**, formed by the cyclization at carbon C⁴ in CF₃-allyl cations **A** (see Fig. 1). The formation of alternative indene structures by cyclization at carbon C² in species **A** was not observed at all. This regioselectivity in reactions of CF₃-cations **A** is contrary to the non-selective behaviour of other allyl cations without the CF₃-substituent.²⁰

Despite that indenenes **3** were formed quantitatively without any further purification, under the attempt of their additional column chromatography isolation with silica gel, the isomerization into other indenenes **4** was observed (Scheme 2). Thus, we developed the procedure for this quantitative isomerization by stirring a solution of compounds **3** in EtOAc in the presence of

Scheme 2 Isomerization of CF₃-indenenes **3** into **4** (see substituents R¹, R² in aryl rings Ar¹, Ar², respectively, in Table 1).

silica gel at room temperature for 4 h (see Scheme 2 for selected indenenes 3/4). Compared with compounds 3, their isomers 4 should be thermodynamically more stable, because of the additional conjugation of the indene $C^2=C^3$ double bond with the aryl group Ar^2 . Some of the indenenes 3 were isomerized very easily. Thus, under the isolation (without column chromatography with silica gel) of 3q, the additional formation of the corresponding isomeric indene 4q was observed (entry 17, Table 1). On the other hand, polymethylated indenenes 3j2, 3l and 3m, bearing a methyl group in the position 7 of the indene system, were not isomerized at all, presumably, because of the steric hindrance from this methyl substituent. Most likely, the presence of the substituent in the indene position 7 is a crucial point for this isomerization. Any bulky group in this position may disturb a flat orientation of ring Ar^2 relatively to the indene plane, which is thermodynamically favorable for conjugation of their π -systems. A shift of the double bond in the indene system with a formation of isomeric indenenes has also been observed under the action of various basic or acidic reagents.^{13,21–23}

Conclusion

We have found a novel, effective and simple method for the synthesis of two series of isomeric CF_3 -indenenes based on acid (H_2SO_4 or CF_3CO_2H)-promoted cyclization of 2,4-diaryl-1,1,1-trifluorobut-3-en-2-oles or their TMS-ethers.

Experimental part

Instruments

The NMR spectra of solutions of compounds in $CDCl_3$ were recorded on a Bruker AVANCE III 400 (at 400, 376 and 100 MHz for 1H , ^{19}F and ^{13}C NMR spectra, respectively) spectrometer at 25 °C. The residual proton-solvent peak $CDCl_3$ (δ 7.26 ppm) for 1H NMR spectra and the carbon signal of $CDCl_3$ (δ 77.0 ppm) for ^{13}C NMR spectra were used as references. ^{19}F NMR spectra were indirectly referred to the signal of $CFCl_3$ (δ 0.0 ppm). HRMS was carried out with a Bruker maXis HRMS-ESI-QTOF and a Varian 902-MS MALDI mass spectrometer. Chromato-mass-spectrometry data were obtained using a Shimadzu QP-2010 Ultra equipped with a SPB-1 SULFUR capillary column (30 m $\times$ 0.32 mm), the thickness of the stationary phase being 1.25 μm . The preparative reactions were monitored by thin-layer chromatography carried out on silica gel plates (Alugram SIL G/UV-254), using UV light for detection. Preparative TLC was performed on silica gel Chemapol L 5/40 with the petroleum ether–ethyl acetate mixture as an eluent.

DFT calculations

All computations were carried out at the DFT/HF hybrid level of theory using the Becke's three-parameter hybrid exchange functional in combination with the gradient-corrected cor-

relation functional of Lee, Yang, and Parr (B3LYP) by using GAUSSIAN 2009 program packages.²⁴ The geometry optimization was performed using the 6-311+G(2d,2p) basis set (standard 6-311 basis set added with polarization (d, p) and diffuse functions). Optimizations were performed on all degrees of freedom, and solvent-phase optimized structures were verified as true minima with no imaginary frequencies. The Hessian matrix was calculated analytically for the optimized structures in order to prove the location of correct minima and to estimate the thermodynamic parameters. Gibbs free energies were calculated at 25 °C. Solvent-phase calculations used the Polarizable Continuum Model (PCM).

Synthesis and characterization of indenenes 3

General procedure for cyclization of compounds 1 or 2 into indenenes 3 in H_2SO_4 . 1 mL of H_2SO_4 (95%) was added in one portion to a solution of 0.1 mmol of compound 1 or 2 in 1 mL of CH_2Cl_2 at room temperature with vigorous stirring. The reaction mixture was stirred for 2 min, then poured into 15 mL of water, and extracted with CH_2Cl_2 (3×15 mL). The combined extracts were washed with water (3×10 mL), dried over Na_2SO_4 . Evaporation of the solvent under reduced pressure finally gave indene 3. Analogously the reactions were carried out in $\text{CF}_3\text{CO}_2\text{H}$ (see Table 1).

Synthesis and characterization of indenenes 4

General procedure for isomerization of indenenes 3 into 4. A suspension of 4 g of silica gel in a solution of 0.1 mmol of indene 3 in 5 mL of EtOAc was stirred at room temperature for 4 h. The silica gel was filtered off, and washed with EtOAc (3 × 20 mL). The solutions in EtOAc were combined, and evaporation of the solvent under reduced pressure quantitatively gave indene 4.

Quantitative yield. Yellow solid. M.p. 49–51 °C. 1H NMR ($CDCl_3$, 400 MHz) δ , ppm: 4.25 qd (1H, C^1H , J 9.3 Hz, J 2.1 Hz), 6.43 d (1H, $=CH$, J 2.1 Hz), 7.35 dt (1H_{arom.}, J 7.4 Hz, J 0.9 Hz), 7.41–7.46 m (3H_{arom.}), 7.50–7.55 m (3H_{arom.}), 7.67 d (1H_{arom.}, J 7.4 Hz). ^{13}C NMR ($CDCl_3$, 100 MHz) δ , ppm: 52.8 q (C^1 , J 29.6 Hz), 121.1, 125.1, 125.2 q (C^2 , J 2.8 Hz), 126.1 q (CF_3 , J 278.6 Hz), 126.7, 128.7, 129.1, 129.2, 133.1, 134.6, 138.7, 143.9, 148.4. ^{19}F NMR ($CDCl_3$, 376 MHz) δ , ppm: -67.23 d (CF_3 , J 9.3 Hz). HRMS (MALDI): $C_{16}H_{11}F_3Cl$ found 295.0496 $[M + H]^+$, calcd 295.0496.

5-Fluoro-1-(trifluoromethyl)-3-(3,4-dimethylphenyl)-1H-indene (4p).

Quantitative yield. Yellow oil. 1H NMR ($CDCl_3$, 400 MHz) δ , ppm: 2.36 (3H, Me), 2.37 (3H, Me), 4.22 br. q (1H, C^1H , J 9.1 Hz), 6.47 c (1H, $=CH$), 7.03 dt (1H_{arom.}, J 8.5 Hz, J 2.2 Hz), 7.25–7.35 m (3H_{arom.}), 7.37 c (1H_{arom.}), 7.60 dd (1H_{arom.}, J 7.7 Hz, J 5.4 Hz). ^{13}C NMR ($CDCl_3$, 100 MHz) δ , ppm: 19.7 (Me), 20.0 (Me), 52.2 q (C^1 , J 29.7 Hz), 109.0 d (J 24.2 Hz), 113.0 d (J 23.2 Hz), 125.1, 125.8 d (J 9.3 Hz), 126.0 q (C^2 , J 2.6 Hz), 126.1 q (CF_3 , J 278.5 Hz), 128.9, 130.2, 131.6, 134.2 m, 137.4 d (J 25.7 Hz), 146.8 d (J 9.0 Hz), 148.8 d (J 2.9 Hz), 163.6 d (J 245.3 Hz). ^{19}F NMR ($CDCl_3$, 376 MHz) δ , ppm: -113.55 to -113.48 m (1F_{arom.}), -67.52 d (CF_3 , J 9.1 Hz). HRMS (MALDI): $C_{18}H_{15}F_4$ found 307.1104 $[M + H]^+$, calcd 307.1107.

5-Fluoro-1-(trifluoromethyl)-3-(3,4-dimethoxyphenyl)-1H-indene (4q).

Quantitative yield. Yellow oil. 1H NMR ($CDCl_3$, 400 MHz) δ , ppm: 3.94 (6H, 2OMe), 4.21 br. q (1H, C^1H , J 8.9 Hz), 6.44 d (1H, $=CH$, J 2.1 Hz), 6.97 d (1H_{arom.}, J 8.2 Hz), 7.02 dt (1H_{arom.}, J 8.7 Hz, J 2.4 Hz), 7.06 d (1H_{arom.}, J 1.9 Hz), 7.14 dd (1H_{arom.}, J 8.2 Hz, J 1.9 Hz), 7.26 dd (1H_{arom.}, J 9.0 Hz, J 2.4 Hz), 7.58 dd (H_{arom.}, J 8.0 Hz, J 5.1 Hz). ^{13}C NMR ($CDCl_3$, 100 MHz) δ , ppm: 52.2 q (C^1 , J 29.8 Hz), 56.1 (OMe), 56.2 (OMe), 108.9 d (J 24.3 Hz), 110.9, 111.5, 113.1 d (J 23.2 Hz), 120.3, 125.8 q (C^2 , J 2.6 Hz), 125.9 d (J 9.2 Hz), 126.0 q (CF_3 , J 278.5 Hz), 126.8, 134.1 m, 146.7 d (J 8.8 Hz), 148.5 d (J 2.9 Hz), 149.6 d (J 44.1 Hz), 163.6 d (J 245.5 Hz). ^{19}F NMR ($CDCl_3$, 376 MHz) δ , ppm: -113.31 dt (1F_{arom.}, J 9.0 Hz, J 5.1 Hz), -67.51 d (CF_3 , J 8.9 Hz). HRMS (MALDI): $C_{18}H_{15}F_4O_2$ found 339.1003 $[M + H]^+$, calcd 339.1009.
