# Grandiflodines A and B, two novel diterpenoid alkaloids from *Delphinium grandiflorum*†

Neng-Hua Chen,<sup>ab</sup> Yu-Bo Zhang,<sup>ab</sup> Wen Li,<sup>ab</sup> Pan Li,<sup>ab</sup> Li-Feng Chen,<sup>ab</sup> Yao-Lan Li,<sup>ab</sup> Guo-Qiang Li<sup>\*c</sup> and Guo-Cai Wang<sup>\*ab</sup>

Two novel diterpenoid alkaloids, grandiflodines A and B (**1** and **2**), were isolated from *Delphinium grandiflorum*. Compound **1** represents a rare hetisine-type C<sub>20</sub>-diterpenoid alkaloid in which the bond between the atoms of N and C-17 is broken. Compound **2** features an unusual lycotonine-type C<sub>19</sub>-diterpenoid alkaloid skeleton with the cleavage of N–C<sub>19</sub> and C<sub>7</sub>–C<sub>17</sub> bonds, and the construction of the N–C<sub>7</sub> bond. Structural elucidations of the isolates were performed by spectroscopic analysis, X-ray diffraction and comparison with the literature. These compounds were tested for their antiviral and anti-inflammatory activities.

## Introduction

The genus *Delphinium* belongs to the family Ranunculaceae and consists of about 300 species distributed throughout the northern hemisphere.<sup>1,2</sup> Among the 300 species, more than 113 ones are endemic to China and about 18 ones are used as folk medicines.<sup>1,2</sup> As an important medicinal plant, *Delphinium* plants are used to treat traumatic injury, analgesia and rheumatism, etc.<sup>1</sup> Recent investigations showed that the diterpenoid alkaloids are the main components of *Delphinium* plants, and the alkaloids possess complex structure skeletons and exhibit a wide spectrum of pharmacological activities.<sup>3–7</sup> Thus, the diterpenoid alkaloids have become an increasing, attractive target for medicinal chemists.<sup>8</sup>

*Delphinium grandiflorum* is a perennial herb mainly distributed in the Northwest of China and some regions of Siberia and

People's Republic of Mongolia.<sup>9</sup> As a folk medicine, the *D. grandiflorum* is applied for the treatment of toothache, and used as native pesticide as well.<sup>9</sup> As part of our ongoing research on the bioactive natural products from *Delphinium* plants,<sup>10</sup> an extensive phytochemical investigation on *D. grandiflorum* was undertaken, leading to the isolation of two novel diterpenoid alkaloids, grandiflodines A and B (**1** and **2**). Compound **1** is a rare hetisine-type C<sub>20</sub>-diterpenoid alkaloid with the cleavage of the bond between the atoms of N and C-17. Compound **2** features an unusual lycotonine-type C<sub>19</sub>-diterpenoid alkaloid skeleton with the cleavage of N–C<sub>19</sub> and C<sub>7</sub>–C<sub>17</sub> bonds, and construction of the N–C<sub>7</sub> bond. Herein, we report the isolation, structure elucidation and biological activities of **1** and **2** (Fig. 1).

## Results and discussion

Grandiflodine A (**1**) was isolated as colorless block crystal. The molecular formula of **1** was established as C<sub>22</sub>H<sub>28</sub>N<sub>2</sub>O<sub>3</sub> by its HR-ESI-MS (*m/z* 369.2175 [M + H]<sup>+</sup>, calcd for C<sub>22</sub>H<sub>29</sub>N<sub>2</sub>O<sub>3</sub>: 369.2173). The UV spectrum of **1** displayed the absorption maxima at 208 nm, and its IR spectrum showed the characteristic absorptions for hydroxyl groups (3479, 3423 cm<sup>−1</sup>), cyanogroup (2228 cm<sup>−1</sup>) and carbonyl group (1673 cm<sup>−1</sup>). The <sup>1</sup>H NMR and HSQC spectroscopic data of **1** provided the resonances for two methyls [ $\delta_{\text{H}}$  1.18, 2.26 (each 3H, s);  $\delta_{\text{C}}$  25.6, 33.4], an olefinic methylene [ $\delta_{\text{H}}$  4.51, 4.67 (each 1H, d, *J* = 1.8 Hz);  $\delta_{\text{C}}$  103.4] and an oxygenated methine [ $\delta_{\text{H}}$  3.36 (1H, t, *J* = 5.8 Hz);  $\delta_{\text{C}}$  72.9]. The <sup>13</sup>C and DEPT NMR data exhibited 22 signals of two methyls, seven methylenes, six methines and seven quaternary carbons, including a cyanogroup ( $\delta_{\text{C}}$  117.6), a pair of double bond ( $\delta_{\text{C}}$  103.4, 150.3) and a carbonyl group ( $\delta_{\text{C}}$  216.9). Detailed comparison of the <sup>1</sup>D NMR data of **1** (Table 1) with those of anhydroignavinol<sup>11</sup> showed that they were similar except for the presence of additional carbonyl and cyanogroup, and the

<sup>a</sup> Measured at 500/125 MHz in DMSO-*d*<sub>6</sub>. <sup>b</sup> Measured at 300/75 MHz in CDCl<sub>3</sub>. Overlapped signals are reported without designating multiplicity.

**Fig. 2** Key <sup>1</sup>H–<sup>1</sup>H COSY and HMBC correlations of **1** and **2**.

absence of two oxygenated methines in **1**. In the HMBC spectrum, the correlations (Fig. 2) between H-1/H-5/H-15 and the carbonyl group ( $\delta_C$  216.9) revealed that the carbonyl group was located at C-17. Moreover, the HMBC correlations between H-21 [ $\delta_H$  2.26, (3H, s)] and C-6/C-18 suggested that the methyl ( $\delta_C$  33.4, C-21) was connected to the nitrogen atom. The above information implied that the N–C<sub>17</sub> bond was broken to form a unique hetidines-type C<sub>20</sub>-diterpenoid alkaloid skeleton as depicted. In addition, the cyanogroup ( $\delta_C$  117.6) was located at C-18 based upon the HMBC correlation between H-18 and C-20 ( $\delta_C$  117.6). And the HMBC correlations between H-3 ( $\delta_H$  3.36, 1H, t, *J* = 5.8 Hz) and C-4/C-18/C-19, between H-11/H-12/H-15/H-16 and C-9 ( $\delta_C$  76.5) indicated that the carbons at C-3 and C-9 were substituted by hydroxyls, respectively. In light of the evidences mentioned above, the planar structure of **1** was finally established.

The relative configuration of **1** could be elucidated by the NOESY experiment. The correlations (Fig. 3) between 3-OH and H-18, between H-19 and H-3/H-5/H-6, as well as between 9-OH and H-5 established the relative configuration of **1**. Finally, the structure and configuration were further elucidated by an X-ray diffraction analysis (Fig. 4). The final refinement of the Cu K $\alpha$  data resulted in a small flack parameter of –0.05 (6) allowing the assignment of the absolute configuration of **1** as 3*R*, 4*R*, 5*R*, 6*S*, 8*S*, 9*S*, 10*S*, 12*S*, 15*S*, 18*R*.

The molecular formula of **2** was deduced as C<sub>33</sub>H<sub>48</sub>N<sub>2</sub>O<sub>10</sub> by HR-ESI-MS at *m/z* 633.3387 [*M* + H]<sup>+</sup> (calcd for C<sub>33</sub>H<sub>49</sub>N<sub>2</sub>O<sub>10</sub>: 633.3382). The <sup>1</sup>H NMR spectrum of **2** displayed the signals of one *ortho*-substituted benzene ring at  $\delta_H$  7.71 (1H, dd, *J* = 8.0, 1.4 Hz), 7.24 (1H, m), 6.64 (1H, m), 6.58 (1H, m), and five methoxys at  $\delta_H$  3.72, 3.62, 3.38, 3.28, 3.24 (each 3H, s). The <sup>13</sup>C and DEPT NMR data displayed thirty-three carbon signals including six methyls, seven methylenes, thirteen methines and seven quaternary carbons. Detailed analysis of the <sup>1</sup>H and <sup>13</sup>C NMR data (Table 1) of **2** showed a number of similarities to those of anthranoyllycoctonine.<sup>12</sup> The most notable differences were the existence of an additional carbonyl ( $\delta_C$  174.9) and an

**Fig. 3** NOESY correlations of **1** and **2**.

Fig. 4 Perspective drawing of the X-ray structure of 1.

additional methoxyl ( $\delta_C$  52.1) in 2. The HMBC correlations between H-3/H-18 and C-19 ( $\delta_C$  174.9), and between 19- $\text{OCH}_3$  ( $\delta_C$  52.1) and C-19 indicated that the N-C<sub>19</sub> bond was broken, and the carbon at C-19 was oxidized to be carbonyl. Furthermore, the HMBC correlations between H-1/H-5/H-21 and the methylene at C-17 ( $\delta_C$  42.3) revealed that the C<sub>7</sub>-C<sub>17</sub> linkage was broken. In addition, the correlation from H-21 to C-7 suggested that a new bond was constructed between the nitrogen atom and C-7. Hence, the planar structure of 2 was established. The relative configuration of 2 was the same as that of anthranolylcoctonine by interpretation of the NOESY data (Fig. 3).<sup>12</sup>

Compounds 1 and 2 were tested for their antiviral effect against the respiratory syncytial virus (RSV), and anti-inflammatory activity on Nitric Oxide (NO) production. Both the two compounds showed no cell cytotoxicity towards the tested cells with the  $\text{CC}_{50}$  values more than 100  $\mu\text{M}$ . Compound 2 displayed weak inhibitory effect on the growth of RSV and the production of NO in tested cells with the  $\text{IC}_{50}$  values of 75.3 and 72.7  $\mu\text{M}$ , respectively, and 1 was virtually inactive with  $\text{IC}_{50}$  values more than 100  $\mu\text{M}$ .

## Conclusions

In summary, compounds 1 and 2, two novel diterpenoid alkaloids were isolated from *D. grandiflorum*. Compound 1 represents a rare hetisine-type C<sub>20</sub>-diterpenoid alkaloid, and 2 features an unusual lycoctonine-type C<sub>19</sub>-diterpenoid alkaloid skeleton, revealing that the alkaloids in *Delphinium* plants possess complex structure skeletons and adding the diversity of alkaloid compositions isolated from *Delphinium* plants. Moreover, the assays of anti-RSV and anti-inflammatory activities showed that these two compounds had little cytotoxicity towards the tested cells, providing more potentiality for further pharmacologic study.

## Experimental section

### General

Melting point was obtained on an X-5 microscopic melting point apparatus. Optical rotations were recorded on a digital JASCO P-2000 polarimeter. UV spectra were obtained using a JASCO V-550 UV/VIS spectrophotometer. IR spectra were measured on a JASCO FT/IR-480 plus FT-IR spectrometer. NMR spectra were obtained by Bruker AV-500/300 spectrometers, with TMS as an internal standard. The chemical shifts ( $\delta$ ) were expressed in ppm and coupling constants ( $J$ ) in Hz. HR-ESI-MS

data was recorded on an Agilent 6210 ESI/TOF mass spectrometer. Analytical HPLC was performed using a Dionex ultimate 3000 system with a Cosmosil C<sub>18</sub> analytical column (5  $\mu\text{m}$ ,  $4.6 \times 250$  mm). Preparative HPLC was performed using an Agilent 1100 liquid chromatograph with a Cosmosil C<sub>18</sub> preparative column (5  $\mu\text{m}$ ,  $20 \times 250$  mm). Column chromatographies were performed with silica gel (80–100, 200–300, 300–400 mesh; Qingdao Marine Chemical Group Co. Ltd, Qingdao, China), ODS (50  $\mu\text{m}$ , 120 Å; YMC) and Sephadex LH-20 (Pharmacia Biotech, Uppsala, Sweden). Silica gel GF<sub>254</sub> plates (Yantai Chemical Industry Research Institute, Yantai, China) were used for thin-layer chromatography (TLC). Fractions were monitored by TLC, and spots were detected with modified Dragendorff's reagent.

### Plant material

The dried rhizomes of *D. grandiflorum* were purchased in Guangzhou, Guangdong Province of China, in July, 2015. The plant was authenticated by Prof. Guang-Xiong Zhou (College of Pharmacy, Jinan University). A voucher specimen (no. 150713) was deposited in the Institute of Traditional Chinese Medicine and Natural Products, Jinan University, Guangzhou, P. R. China.

### Extraction and isolation

The air-dried and powdered rhizome (10.0 kg) was extracted four times with 95% alcohol ( $4 \times 35$  L) at room temperature. After evaporation of alcohol, the crude extract (492.2 g) was suspended in water (2 L) and acidified with HCl to pH = 4–5, then partitioned with  $\text{CHCl}_3$  ( $3 \times 4$  L) to give a water-soluble fraction. The water-soluble fraction was basified with  $\text{NH}_3 \cdot \text{H}_2\text{O}$  to pH = 9–10 and then partitioned with a  $\text{H}_2\text{O}/\text{CHCl}_3$  mixture to give a  $\text{CHCl}_3$ -soluble fraction (63.0 g). The  $\text{CHCl}_3$ -soluble fraction was chromatographed on silica gel column (300–400 mesh, 1000 g) eluted with a solvent system of  $\text{CHCl}_3/\text{CH}_3\text{OH}$  (100 : 0 to 0 : 100, v/v), yielding six fractions (Fr.A–F). Fr.B (9.2 g) was further separated on an ODS column (200 g) eluted with  $\text{MeOH}/\text{H}_2\text{O}$  (30 : 70 to 100 : 0, v/v) to afford 9 sub-fractions (Fr.B1–B9). Fr.B5 (1.2 g) were purified by Sephadex LH-20 ( $\text{MeOH}/\text{CHCl}_3$ , 1 : 1, v/v) and compound 1 (15.0 mg) was crystallized from the eluent. Then 2 (12.3 mg) was obtained by the preparative HPLC with  $\text{MeOH}/\text{H}_2\text{O}$  (68 : 32, v/v) from Fr.B5.

**Grandiflodine A (1).** Colorless and block crystals ( $\text{MeOH}$ ); mp 273–274 °C;  $[\alpha]_D^{19} +6.8$  ( $c$  0.6, DMSO); UV ( $\text{MeOH}$ )  $\lambda_{\text{max}}$  (log  $\epsilon$ ) 208.6 (3.57) nm; IR (KBr)  $\nu_{\text{max}}$  3480, 3423, 2933, 2876, 2228, 1674, 1462, 1057, 1054, 894  $\text{cm}^{-1}$ ;  $^1\text{H}$  and  $^{13}\text{C}$  NMR data see Table 1; HRESIMS  $m/z$  369.2175 (calcd for  $\text{C}_{22}\text{H}_{29}\text{N}_2\text{O}_3$ , 369.2173).

**Grandiflodine B (2).** White powder;  $[\alpha]_D^{25} +10.7$  ( $c$  0.96,  $\text{MeOH}$ ); UV ( $\text{MeOH}$ )  $\lambda_{\text{max}}$  (log  $\epsilon$ ) 219.5 (3.78), 250.2 (3.30), 340.5 (3.18) nm; IR (KBr)  $\nu_{\text{max}}$  3455, 2931, 2874, 1677, 1453, 1360, 1189, 1055, 893  $\text{cm}^{-1}$ ;  $^1\text{H}$  and  $^{13}\text{C}$  NMR data see Table 1; HRESIMS  $m/z$  633.3382 (calcd for  $\text{C}_{33}\text{H}_{49}\text{N}_2\text{O}_{10}$ , 633.3387).

**X-ray crystallographic analysis of 1.** Colorless blocks,  $\text{C}_{22}\text{H}_{28}\text{N}_2\text{O}_3$ ,  $M_r = 368.46$ ; monoclinic, space group  $P2_1$ ;  $a = 9.7305$  (2) Å,  $b = 8.76406$  (16) Å,  $c = 11.0765$  (2) Å,  $\alpha = 90^\circ$ ,  $\beta = 109.45$  (2)°,  $\gamma = 90^\circ$ ;  $V = 890.68$  (3) Å<sup>3</sup>,  $Z = 2$ ,  $d_x = 1.374$  Mg  $\text{m}^{-3}$ ,

$F(000) = 396.0$ ,  $\mu(\text{Cu K}\alpha) = 0.731 \text{ mm}^{-1}$ . Data collection was performed on a Gemini S Ultra using graphite-monochromated radiation ( $\lambda = 1.54184 \text{ \AA}$ ); 2829 unique reflections were collected to  $\theta_{\text{max}} = 125.536^\circ$ , where 14 056 reflections were observed [ $F_2 > 2\sigma(F_2)$ ]. The structure was solved by direct methods (SHELXS 97)<sup>13</sup> and refined by full-matrix least-squares on  $F_2$ . Final  $R = 0.0297$ ,  $R_w = 0.0840$ , and  $S = 1.111$ . Crystallographic data for these structures have been deposited with the Cambridge Crystallographic Data Center as CCDC 1517870 for compound **1**.

### Assay of anti-RSV activities on Hep-2 cells

The human larynx epidermoid carcinoma (Hep-2, ATCC CCL-23) cells and RSV A2 (ATCC VR-1540) strains were purchased from Medicinal Virology Institute, Wuhan University, China. Hep-2 cells were cultured in DMEM (Gibco) supplemented with  $100 \text{ U mL}^{-1}$  penicillin and streptomycin solution, and virus was propagated in Hep-2 cells and incubated in DMEM with  $2 \text{ mM}$  L-glutamine, 2% FBS, and  $100 \text{ U mL}^{-1}$  penicillin and streptomycin solution. All of the cells were cultured in a 95% humidified atmosphere supplied with 5%  $\text{CO}_2$  at  $37^\circ\text{C}$ , and the ribavirin (Sigma, purity of 99%) was used as the positive control. The cytotoxicity of the compounds toward Hep-2 cells was detected by the MTT assay in 96-well plates (Corning) with the optical density (OD) values measured in an enzyme immunoassay reader (Thermo Labsystems Multiskan MK3) at  $570 \text{ nm}$ , and the 50% cytotoxic concentration ( $\text{CC}_{50}$ ) was estimated by regression analysis. The antiviral activities of the isolates against the RSV-A2 strain were assessed by the CPE reduction assay as reported in previous paper.<sup>14</sup> The concentration that reduces 50% of CPE with respect to the virus control was estimated from the plots of the data and was defined as the 50% inhibitory concentration ( $\text{IC}_{50}$ ) of the tested compounds.

### Assay of anti-inflammatory activities on NO production toward RAW 264.7 cells

RAW 264.7 cells were provided by the Medicinal Virology Institute of Wuhan University and maintained in DMEM (Gibco) containing 10% FBS (Gibco), and supplemented with  $100 \text{ U mL}^{-1}$  penicillin and streptomycin solution. Cells were cultured at  $37^\circ\text{C}$  in a 95% humidified atmosphere supplied with 5%  $\text{CO}_2$ . The cytotoxicity of the compounds on RAW 264.7 cells was detected by the MTT assay in 96-well plates with the OD values measured at  $570 \text{ nm}$ , and the  $\text{CC}_{50}$  was estimated by regression analysis. The anti-inflammatory activities of the compounds were evaluated by the inhibitory effect on NO production. RAW 264.7 cells ( $4 \times 10^4$  cells per well) were incubated in a 96-well plate for 14 h and then pretreated with  $100 \text{ ng mL}^{-1}$  LPS and different concentrations of compounds ( $6.25$ –

$100 \text{ }\mu\text{M}$ ) for 24 h. Then, the Griess reagent ( $100 \text{ }\mu\text{L}$ ) was added and blended with the supernatant ( $100 \text{ }\mu\text{L}$ ), and the absorbance was measured at  $540 \text{ nm}$  with an enzyme immunoassay reader. NO levels were determined *via* a calibration curve constructed with  $\text{NaNO}_2$  concentrations of  $3.12$ – $100 \text{ }\mu\text{M}$ . Inhibitory effects of compounds on NO production ( $\text{IC}_{50}$ ) were calculated by regression analysis of the dose–response curve generated from the data.
