Internal asymmetric induction by the C-6 substituent on the oxidation reaction of interglycosidic sulfur atom of thiodisaccharides†

 J. P. Colomer,^{*a} A. B. Peñeñory ^a and O. Varela ^{*bc}

Since the enantio or diastereoselective preparation of sulfoxides is a current challenge, we explore the possibility of inducing diastereoselectivity in the oxidation of the sulfur atom of thiodisaccharides, according to their substitution patterns. Thus, a series of 3-deoxy-4-*S*-(β -D-glucopyranosyl)-4-thio- β -D-xylo-hexopyranoside derivatives, with different substituents at C-6 (OH, OAc or OTBS) of the reducing end, have been synthesized and treated with *m*-CPBA for the oxidation of the sulfur atom at C-4, which is vicinal to C-6. The absolute configuration at the sulfur stereocenter of the resulting sulfoxides was established taking into account shielding/deshielding anisotropic effects of the S=O bond on the chemical shift of the NMR signals of selected protons, in the most populated *syn* ϕ /*syn* ψ conformation of the thiodisaccharide *S*-oxides. The OAc and OTBS derivatives afforded diastereomeric mixtures of *R* and *S* sulfoxides in a similar ratio (1.4 : 1 and 1.6 : 1, respectively). In contrast, the oxidation of thiodisaccharide with a free hydroxyl group at C-6 was completely diastereoselective in favor of the *R* sulfoxide. The influence of the thiodisaccharide C-6 substituent on the stereochemical course of the oxidation is discussed.

Introduction

Numerous organic molecules containing sulfoxide functionality show a wide range of interesting biological activities. Many compounds of this type are employed as pharmaceuticals (*e.g.*, sulforaphane,¹ esomeprazole,² and armodafinil³) and present a specific configuration at the sulfur stereocenter, which is crucial to generate the desired biological effect. In addition, enantiomerically pure sulfoxides are employed as powerful chiral auxiliaries, ligands or catalysts in asymmetric synthesis.^{4–7} Therefore, the enantio or diastereoselective preparation of sulfoxides is a current challenge for synthetic organic chemists. In this regard, a number of procedures for the diastereoselective or enantioselective (including enzymes or microorganisms) sulfoxidations have been reported.^{8–11}

The oxidation of the sulfur atom of thioglycosides usually affords diastereomeric mixtures of glycoside sulfoxides, and the

diastereoselectivity relies on the solvent, the temperature and the structure and substitution of the starting *S*-glycoside.¹² In some particular cases, high diastereoselectivities in the oxidation of thioglycosides have been achieved.¹³ Witczak and coworkers¹⁴ reported the oxidation of thiodisaccharides to sulfoxides or sulfones, derivatives that inhibit the proliferation of selected murine and human tumor cell lines. However, the sulfoxides were obtained as diastereomeric mixtures and the absolute configuration of the SO group has not been established.

In connection with our work on the synthesis of thiodisaccharides and their inhibitory activity of specific glycosidases,^{15–19} we have studied the oxidation of these substrates to their respective diastereomeric sulfoxides. These compounds could be successfully separated in many cases and the absolute configuration of the sulfur stereocenter was determined by a procedure developed by us.^{20,21} This procedure is based on NMR techniques and takes into account anisotropic effects of the S=O group. Our results were in agreement with those obtained using other methodologies employed to assign the sulfur absolute configuration of glycosyl sulfoxides.^{13,22–24}

The diastereomers *R_S* and *S_S* of sugar sulfoxides are hydrolyzed with different kinetics by acids or glycosidases.¹² Thus, we have prepared and assigned the configuration of sulfur for both isomers of benzyl 3-deoxy-4-*S*-(β -D-galactopyranosyl)-4-thio- β -D-threo-pentopyranoside *S*-oxides, which showed to be competitive inhibitors of the β -galactosidase from *Escherichia coli*.^{20,21} The key structural features of the molecular recognition process have been determined using NMR techniques and molecular

modelling.²⁵ The different configuration at sulfur resulted in dissimilar conformational behavior and in a distinctive geometrical disposition of the molecule in the active site of the enzyme. These structural modifications justify the different rates of hydrolysis observed for each diastereoisomer.

Due to the importance of a specific configuration at the sulfur stereocenter of sulfoxides and as continuation of our previous work on this subject, we report herein the study of the oxidation of 3-deoxy-*S*-(1→4)-disaccharides, with the aim of achieving high diastereoselectivity in the reaction.

Results and discussion

In order to determine the influence of the C-6 substituent of the reducing end, vicinal to the sulfur at C-4, on the stereochemical course of the oxidation of this atom, a series of 3-deoxy-*S*-(1→4)-disaccharides was synthesized. Thus, the synthetic route employed involved the conjugate addition of 1-thioaldose derivatives to sugar enones followed by reduction of the carbonyl group, which proved to be highly diastereoselective and high yielding.^{17,19} As Michael acceptors, the sugar enones 1–3, with the C-6 hydroxyl group unprotected (2) or substituted as acetyl ester (1) or *tert*-butyldimethylsilyl ether (TBS, 3), were prepared (Scheme 1). The enone 1 was obtained by the methodology previously described.²⁶ The deacetylation of 1 to afford 2 was conducted under mild conditions using bis(tributyltin) oxide²⁷ (TBTO) in order to avoid the elimination of the AcO group at C-6.

Scheme 1 Synthetic sequence to obtain 2*H*-pyran-3(6*H*)-ones 1–3.

Scheme 2 Michael addition of thioaldose 4 to 2*H*-pyran-3(6*H*)-ones 1 and 3, followed by reduction, to afford thiodisaccharides 6–11.

The silylation of the free hydroxyl group of 2 was performed with *tert*-butyldimethylsilyl chloride (TBSCl) in MeCN to give the enone 3.

The conjugate addition of 2,3,4,6-tetra-*O*-acetyl-1-thio-β-*D*-glucopyranose²⁸ (4) to 2*H*-pyran-3(6*H*)-ones 1 or 3 was conducted at –18 °C for 1.5 h, in the presence of a catalytic amount of triethylamine (Et₃N). As already described in previous work, and to avoid the retro-Michael reaction,¹⁹ the crude mixture of 2-keto thiodisaccharides 5 (Scheme 2) was treated with sodium borohydride in MeOH (0 °C, 30 min) for the reduction of the carbonyl group, to afford the 3-deoxy-4-*S*-glycosyl-4-thiohexopyranosides 6–8 (from 1) and 9–11 (from 3). The control of the temperature was important in order to increase the diastereoselectivity during the sequence. The NaBH₄ reduction requires also a short time, as longer reaction times led to partial de-*O*-acetylation of the products.

The mixtures obtained were subjected to column chromatography. The major product isolated starting from 1 was the thiodisaccharide 6. The ¹H NMR spectrum of 6 revealed small coupling constant values for 4-H, which appeared as a broad singlet, and for 2-H ($J_{1,2} = 3.5$ Hz, $J_{2,3eq} = J_{3eq,4} = 3.7$ Hz) indicating the *R* configuration for the new stereocenters at C-4 and C-2 (3-deoxy-*D*-xylo-hexopyranoside configuration for the reducing end). Similarly, the coupling constant values determined for 4-H ($J_{3ax,4} = J_{4,5} = 12.8$, $J_{3eq,4} = 3.9$ Hz) and for 2-H ($J_{1,2} = 1.8$, $J_{2,3eq} = 4.3$, $J_{2,3ax} = 12.3$ Hz), are indicative that the thiodisaccharide 8, which was isolated as a minor product, possessed respectively the *R* and *S* configuration at C-2 and C-4 (3-deoxy-*D*-ribo-hexopyranoside). The large *J* values observed for $J_{2,3ax}$, $J_{3ax,4}$ and $J_{4,5}$ are result of the axial disposition for both 2-H and 4-H, in the preferred chair conformation of the 3-deoxy-pyranoside unit. A third minor component of the mixture was the thiodisaccharide 7, which was contaminated with a non-reduced 2-keto thiodisaccharide 5. However, some signals such as 1-H (broad singlet), 2-H ($J_{2,3a} = J_{2,3b} = 4.6$ Hz) and 4-H

(broad singlet) allowed us to assign the configuration of the reducing end of **7** as 3-deoxy-D-lyxo-hexopyranoside.

Thiodisaccharide **9** was the main product obtained from the enone **3**. This compound showed the same configuration at C-4 and C-2 as that of **6**, with equatorial disposition for 4-H (broad doublet) and axial for 2-H ($J_{1,2} = 3.7$, $J_{2,3\text{eq}} = 3.3$ Hz).

The thiodisaccharides **10** and **11** were also isolated as an inseparable mixture, in a 3.3 : 1 ratio, respectively. The configuration of the new stereocenters at C-4 and C-2 of **10** and **11** were also assigned on the basis of ^1H NMR signals that appeared in a clean region of the spectrum (no overlapped with other resonances). In the case of **10**, the small coupling constant values for 4-H (broad doublet) and 1-H (broad singlet) suggested an equatorial disposition for both protons (3-deoxy-D-lyxo-hexopyranoside configuration). The NMR spectrum of thiodisaccharide **11** showed coupling constant values for 4-H ($J_{3\text{ax},4} = 13.5$, $J_{3\text{eq},4} = 4.2$, $J_{4,5} = 11.1$ Hz) and 2-H ($J_{1,2} = 3.5$, $J_{2,3\text{ax}} = 12.4$ Hz) in agreement with the axial disposition of 4-H and 2-H (3-deoxy-D-ribo-hexopyranoside configuration).

The diastereofacial selectivity observed for the conjugate addition reaction was attributed to the stereocontrol exerted by the axial disposition of the benzyloxy group of dihydropyranones **1** and **3**, in the preferred $^0\text{H}_5$ conformation.²⁹ This conformation is stabilized by the anomeric effect, increased by the carbonyl group vicinal to the anomeric position,³⁰ and also because of the equatorial orientation of the bulky substituted hydroxymethyl group. Similarly, the diastereofacial selectivity in the borohydride reduction, in favor of the thiodisaccharides **6** and **8**, was also attributed to the stereocontrol produced by the axial benzyloxy group, which induced the approach of the hydride from the Si face of the carbonyl. On the other hand, the reduction of the 6-*O*-TBS substituted intermediate **5**, led to an approximately 1 : 1 ratio of **9** : **10**. Probably the steric hindrance generated by the silyloxymethyl group (even in an equatorial disposition) in combination with the axially disposed thioglycoside unit, both opposite to the benzyloxy group, could encumber the stereocontrol exerted by this anomeric substituent, leading to a higher proportion of **10**.

The free hydroxyl group of thiodisaccharides **6** and **9** was subjected to acetylation leading to compounds **12** and **13**, which differ in the substitution at C-6. Furthermore, in order to obtain an analogue with the 6-OH unprotected, the TBS group of compound **13** was removed using a solution of tetrabutylammonium fluoride (TBAF) in THF to afford the desired thiodisaccharide **14** (Scheme 3).

Having in hand the thiodisaccharides **12**–**14**, with the same configuration of all the stereocenters but different substitution at 6-C (OAc, OTBS and OH), they were subjected to oxidation of

the sulfur atom employing *m*-chloroperoxybenzoic acid (*m*-CPBA) (Scheme 4). The reaction was conducted in 1 : 1 $\text{CH}_2\text{Cl}_2/\text{Et}_2\text{O}$ at 0 °C for 30 min, in order to prevent the oxidation to the sulfone. Thus, the oxidation of **12** or **13** gave the diastereomeric mixture of sulfoxides **15R,S** or **16R,S**, respectively. These poor selectivity is in agreement with the results of Crich and coworkers,³¹ who reported that oxidation of equatorial thioglycosides (β configuration) afforded mixtures of sulfoxides, while the oxidation of axial thioglycosides (α configuration) are usually highly diastereoselective.

All the efforts to separate the diastereomeric mixture **15R,S** were unsuccessful. However, isomer **15R** could be isolated in pure form by means of the procedure described below. Fortunately, the mixture of sulfoxides **16R** and **16S**, obtained from **13** in 96% overall yield, could be separated by column chromatography. Interestingly, the oxidation of **14** was highly diastereoselective to afford **17** as a single product in 80% yield. The stereoisomer **15R** was obtained through a short synthetic route starting from **16R**, which was treated with TBAF for *O*-desilylation to afford **17R**. The NMR spectra of **17R** were identical to the product of oxidation of **14**. Acetylation of **17R** led to **15R**.

The absolute configuration at the sulfur stereocenter of each individual sulfoxide was determined following the procedure reported from our laboratory.^{20,21} For this purpose, it was necessary to establish the predominant conformations adopted for each diastereoisomer, as result of the rotation of the thioglycosidic linkage. These conformations (rotamers) can be described according to the torsion angles ϕ (H-1'-C-1'-S-C-4) and ψ (C-1'-S-C-4-H) defined for such a linkage. The presence of a given rotamer may be determined by the experimental detection of characteristic interresidue NOE interactions.^{16,32–34} Furthermore, the shielding/deshielding effects on the signals of specific protons in the ^1H NMR spectrum were analyzed. Such effects are produced by the anisotropy of S=O bond (considered to be of acetylenic character and with axial symmetry) and with the shielding cones oriented along the S=O linkage.³⁵ Additionally, the shielding effect on hydrogen atoms disposed α *anti*-axial to the lone pair of electrons of the sulfoxide group must be considered, as well as the deshielding of protons having a *syn*-axial orientation with respect to the S=O bond.^{35–38}

The oxidation of **12** afforded an inseparable mixture of sulfoxides **15R,S** (which was later determined to be in a ratio **15R** : **15S** 1.4 : 1). The ^1H and ^{13}C NMR spectra of the mixture were clear enough to assign all the signals of each individual sulfoxide. As explained above, the assignment of the sulfur atom configuration required the evaluation of the conformation of these molecules. The coupling constants values (J) observed for the vicinal protons of **15** indicated, as expected, a strong preference for the $^4\text{C}_1$ conformation of both hexopyranose rings. These conformations were confirmed, for each diastereoisomer, by the presence of characteristic intraresidue NOE cross peaks (3_{ax}-H-5-H; 1'-H-3'-H, 1'-H-5'-H, 3'-H-5'-H, and 2'-H-4'-H) in the NOESY spectrum of **15**. Key interresidue NOE contacts were also detected, that allowed the assignment of the most populated rotamers around of the thioglycosidic linkage. Thus, the major isomeric sulfoxide (later assigned as **15R**) showed an intense interresidue NOE contact between 3eq-H-1'-

Scheme 3 Desilylation reaction of compound **13** to obtain the thiodisaccharide **14**.

Scheme 4 Oxidation reaction of thiodisaccharides 12–14.

H, and a barely perceptible cross-peak between 4-H–1'H suggesting the presence of the *syn* ϕ /*syn* ψ rotamer. The lack of NOE interactions between 2-H–1'-H and 4-H–2'-H revealed that the respective *syn* ϕ /*anti* ψ and *anti* ϕ /*syn* ψ rotamers were practically absent. This result is in agreement with the reported preferred conformation adopted for (1→4)-thiodisaccharides.^{32,33} This rotamer is stabilized by the exo-anomeric effect generated by the sulfur lone-pair disposed *anti* to the polar C-1'-O-1' bond. Similarly to **15R**, the NOESY spectrum of **15S** showed as major rotamer the *syn* ϕ /*syn* ψ (cross peak between 4-H–1'-H) and the *anti* ϕ /*syn* ψ (weak cross peak 4-H–2'-H) as minor conformer.

On the other hand, the oxidation reaction of thiodisaccharide **13** afforded the sulfoxides **16R** (59% yield) and **16S** (37%), which were separated by column chromatography. The coupling constants values (*J*) observed for the vicinal protons of **16R** and **16S** also indicated, the almost exclusive ⁴C₁ conformation of both hexopyranose rings. The presence of some characteristic intraresidue NOE cross peaks in the NOESY spectra of these sulfoxides also confirmed this observation (1'-H–3'-H, 1'-H–5'-H, 3'-H–5'-H, and 2'-H–4'-H). The predominance of the *syn* ϕ /*syn* ψ form for **16R** was established on the basis of the NOE interactions between 3eq-H–1'-H. The detection of a very weak interaction 4-H–2'-H suggested low population of the *anti* ϕ /*syn* ψ conformer. Similarly, the isomer **16S** showed the same preference for the *syn* ϕ /*syn* ψ rotamer (strong interaction between 4-H–1'-H) and the barely perceptible cross-peak 4H–2'-H was indicative of a very low population of the *anti* ϕ /*syn* ψ form.

Interestingly, oxidation of the thiodisaccharide **14** was highly diastereoselective to give the sulfoxide **17R** as the unique isomer, in 80% yield. As for the other sulfoxides already

described, **17R** showed a preference for the ⁴C₁ conformation for both hexopyranose rings, and the intense cross peak 3eq-H–1'-H in the NOESY spectrum suggested the *syn* ϕ /*syn* ψ as the main rotamer.

Finally, the absolute configuration of the sulfur stereocenter of each sulfoxide was established according to the chemical shifts observed in their respective ¹H NMR spectra. The chemical shift values for the signals of the more relevant protons are listed in Table 1. As can be seen, the protons 2-H and 3eq-H are more deshielded in **15S** than in **15R**, while 5-H, 6a-H and 6b-H are more shielded in **15S** compared with **15R**. These chemical shift differences could be explained considering the anisotropic effects of the S=O bond on the given protons, according to their relative special orientation. Thus, as shown in Fig. 1, in the *syn* ϕ /*syn* ψ conformation of **15S** (*S* configuration at the sulfur stereocenter) the protons 2-H and 3eq-H are located within the deshielding cone of S=O bond; while 5-H, 6a-H and 6b-H are placed near to the sulfur lone pair, lying in a shielding zone. Similar effects operating in the *syn* ϕ /*syn* ψ conformation of isomer **15R** justify the chemical shifts observed. Thus, the signals of 2-H and 3eq-H appeared upfield in **15R**, with respect to those of **15S**, as such protons are sited near to sulfur lone pair, in a protection zone. In contrast 5-H, 6a-H and 6b-H are located in the deshielding region of the S=O bond.

The same analysis allowed us to establish the absolute configuration at the sulfur atom of **16S** and **16R**. As these isomers are populating the same rotamer conformations as found for **16S** and **16R**, respectively, the invoked anisotropic effects justify the chemical shifts of the protons located near to the S=O group. Thus, the signal of 2-H and 3eq-H are shifted downfield in **16S** respect to **16R**, while the opposite displacements are observed for the signals of 5-H, 6a-H and 6b-H, which are shifted upfield in **16S** respect to **16R**. It is worth to mention that our assignments are in agreement with those predicted by the empirical rule which states that the signal of the anomeric carbon (C-1') of the *R_S* diastereoisomer is shielded upfield with respect to the same signal in the *S_S* counterpart.^{23,39}

The absolute configuration of **17R** was assigned, as a first approximation, by comparison of the chemical shift values of the signals of 2-H and 3eq-H of **17R** with those of sulfoxides **15S**, **15R**, **16S** and **16R**. These two protons, in contrast with 5-H, 6a-H and 6b-H, are located at a major distance of C-6, and therefore are less affected by the electronic properties of different

Table 1 Relevant ¹H NMR chemical shift values of thiodisaccharide sulfoxides useful to determine the absolute configuration at sulfur stereocenter

substituents at C-6. Thus, the chemical shift values observed for the signals of 2-H and 3eq-H of **17R** (Table 1), and also the $\delta_{1-C'}$, were very similar to those measured for **15R** and **16R**, suggesting that the absolute configuration of the sulfoxide was also *R*. It is important to mention that this analysis could be performed, because all the thiodisaccharide sulfoxides present the same preferred *syn* ϕ /*syn* ψ conformation. Therefore, the relative orientations and anisotropic effects of the S=O bond are expected to be very similar for compounds with the same S=O configuration. This assignment was confirmed by conducting the silylation of the OH-6 of **17R**. The NMR spectra of the product obtained were identical to those of **15R**, indicating that **17R** possessed the same absolute *R* configuration at the sulfur stereocenter.

Next, in order to determine the diastereoselectivity observed in the oxidation reaction of **12–14**, the conformations of these thiodisaccharides were assessed. As for the corresponding sulfoxides, the NOESY spectra of thiodisaccharides **12–14** exhibited clear 3eq-H-1'-H and 4-H-1'H interresidue cross peaks, suggesting again the *syn* ϕ /*syn* ψ as major rotamer in the conformational equilibrium. The diastereoselectivity in the oxidation of thiodisaccharides **12** and **13** were similar, even when the size of the substituents of C-6, vicinal to the sulfur atom, is different (*tert*-butyldimethylsilyloxy *versus* acetoxy). In order to explain this behavior, the spatial arrangement of the TBSO group of **13** was investigated by NOESY spectroscopy. The NOESY spectrum of **13** showed NOE interactions between the methyl and *t*-butyl protons of TBS with 5-H as well as between the TBS-*t*-butyl and PhCH₂O protons. These cross peaks suggested that the TBS group was located remote to the sulfur reactive center (probably in a *gt* conformation for the

substituted hydromethyl group) and hence the steric hindrance of TBS on sulfur should be negligible. Therefore, the chemical environment of sulfur should be similar in the preferred *syn* ϕ /*syn* ψ conformation of thiodisaccharides **12** and **13**, giving rise to a similar diastereoselectivity during the oxidation. On the other hand, the NOESY spectrum of **14** showed a NOE interaction between OH and H-4, indicating that the hydroxyl group was disposed in the proximity of the sulfur reactive center. Therefore, as described for the epoxidation reaction of allylic alcohols (Henbest rule),^{40,41} the hydroxyl group at C-6 can interact by hydrogen bonding with *m*-CPBA, and then deliver the oxidant to the pro-(*R*) lone pair of electrons of S, which is the closer electron pair in space in the *syn* ϕ /*syn* ψ conformation, with complete diastereoselectivity (Scheme 5).

Once established the configuration at the sulfur stereocenter of all thiodisaccharides *S*-oxides, we proceed with the *O*-deacetylation of the sulfoxide obtained with complete diastereoselectivity **17R**. The hydrolysis of the acetyl protecting groups was performed with a mixture of MeOH/Et₃N/H₂O (4 : 1 : 5) to

Scheme 5 Diastereoselective delivery of oxygen from *m*-CPBA to the pro-(*R*) lone pair of electrons of sulfur of **14**.

Scheme 6 Deprotection of thiodisaccharide S-oxide **17R**.

lead the free 3-deoxy-*S*-(1→4)-disaccharide *S*-oxide **18R** in very good yield (Scheme 6). The evaluation of the free glycosyl sulfide as enzyme inhibitor, as well as antitumor agents, is underway.

Conclusions

The oxidation reaction of the sulfur atom of benzyl 2-*O*-acetyl-3-deoxy-4-*S*-(2,3,4,6-tetra-*O*-acetyl- β -D-glucopyranosyl)-4-thio- β -D-xylo-hexopyranosides, with different substituents on C-6 (**12**–**14**), was performed employing *m*-CPBA as oxidant. The absolute configuration at the sulfur stereocenter of each sulfoxide was established taking into account shielding/deshielding anisotropic effects of the S=O bond on the chemical shift of the NMR signals of selected protons, in the most populated *syn* ϕ /*syn* ψ conformation of the thiodisaccharide *S*-oxides.

Oxidation of the sulfur atom of thiodisaccharides with the hydroxymethyl group (C-6) substituted with acetyl (**12**) or TBS (**13**) afforded the diastereomeric mixtures of sulfoxides **15R,S** and **16R,S**, in a similar ratio (1.4 : 1 and 1.6 : 1, respectively). In contrast, the oxidation of thiodisaccharide **14**, with a free hydroxyl group at C-6 led to a single sulfoxide with *R* configuration (**17R**). Under the reaction conditions employed, the oxidation of all the thiodisaccharides studied was in favor of the *R*-isomer. The selectivity observed may be justified taking into account that, in the most populated *syn* ϕ /*syn* ψ conformer of the precursors, the pro-*R* lone pair of electrons of sulfur is less hindered than the pro-*S*. The comparable selectivity in the oxidation reaction of **12** and **13** suggested a similar environment around the sulfur atom. In fact, the TBS substituent on **13** was located remote to this reactive center (as shown by NOE experiments) and the steric hindrance produced by the bulky group should be negligible. The asymmetric induction in the oxidation of **14** may be attributed to a hydrogen bonding interaction of the OH group with *m*-CPBA, delivering the oxidant to the pro-*R* lone pair of electrons, which is closer in space in the *syn* ϕ /*syn* ψ conformation of the thiodisaccharide. In agreement with this result, an enhanced diastereoselectivity was observed for the oxidation of thioglycosides when the vicinal OH group at C-2 was unprotected.^{12,39}

Experimental section

General methods

Column chromatography was carried out with silica gel 60 (230–400 mesh). Analytical thin-layer chromatography (TLC) was carried out on silica gel 60 F254 aluminium backed plates (layer thickness 0.2 mm). Compounds were visualized by UV absorption at 254 nm, and by charring with a solution of

(NH₄)₆Mo₇O₂₄·4H₂O 25 g L⁻¹, (NH₄)₄Ce(SO₄)₄·2H₂O 10 g L⁻¹ and 10% H₂SO₄ in H₂O. Optical rotations were measured at 25 °C in a 1 dm cell in the solvent indicated. Nuclear magnetic resonance (NMR) spectra were recorded at 400 or 500 MHz (¹H) and 100.0 or 125.7 MHz (¹³C). Chemical shifts were referred to tetramethylsilane or to the residual solvent peak (CHCl₃: ¹H: δ = 7.26 ppm, ¹³C: δ = 77.2 ppm). Assignments of ¹H and ¹³C NMR spectra were supported by 2D ¹H-COSY, NOESY and 2D ¹H-¹³C HSQC and HMBC experiments. High-resolution mass spectra (HRMS) were obtained using the electrospray ionization (ESI) technique and Q-TOF detection.

Benzyl 3,4-dideoxy- α -D-glycero-hex-3-enopyranosid-2-ulose (2). A solution of enone **1** (282 mg, 1.01 mmol), TBTO (1 mL, 1.96 mmol) in toluene (8 mL) was stirred at 80 °C for 20 h. The reaction was monitored by TLC (pentane/EtOAc, 1 : 1), until complete conversion of the starting material (*R*_f = 0.80) into a more polar product (*R*_f = 0.52). The mixture was concentrated and the residue dissolved in MeCN (60 mL) and extracted with hexane (4 × 30 mL). The acetonitrile phase was concentrated and the residue was purified by column chromatography using hexane/EtOAc (2 : 1 → 1 : 1) as eluent, to give enone **2** (213 mg, 90%) as a light yellow syrup. [α]_D²⁸ = +65.5 (*c* = 1.0, CHCl₃). ¹H NMR (400 MHz, CDCl₃): δ = 7.37–7.30 (m, 5H, PhCH₂O), 6.98 (dd, *J*_{3,4} = 10.6, *J*_{4,5} = 1.6 Hz, 1H, 4-H), 6.20 (dd, *J*_{3,4} = 10.6, *J*_{3,5} = 2.3 Hz, 1H, 3-H), 5.00 (s, 1H, 1-H), 4.83 (d, *J* = 11.8 Hz, 1H, PhCH₂O), 4.74 (d, *J* = 11.8 Hz, 1H, PhCH₂O), 4.61 (m, 1H, 5-H), 3.85 (br. d, *J*_{6a,6b} = 11.3 Hz, 1H, 6a-H), 3.77 (dd, *J*_{6a,6b} = 10.9, *J*_{5,6b} = 4.4 Hz, 1H, 6b-H), 1.90 (br. s, 1H, OH) ppm. ¹³C NMR (100 MHz, CDCl₃): δ = 188.6 (C-2), 148.2 (C-4), 136.8, 128.7, 128.3 (×2) (C-aromatic), 126.6 (C-3), 97.3 (C-1), 71.3 (PhCH₂O), 69.7 (C-5), 64.4 (C-6) ppm. HRMS (ESI): calcd for C₁₃H₁₄NaO₄ 257.0784 [M + Na]⁺; found 257.0793.

Benzyl 3,4-dideoxy-6-*O*-(*tert*-butyldimethylsilyl)- α -D-glycero-hex-3-enopyranosid-2-ulose (3). To a solution of enone **2** (614 mg, 2.62 mmol) and TBSCl (526 mg, 3.49 mmol) in MeCN (3.2 mL) was added imidazole (396 mg, 5.82 mmol). The mixture was stirred at room temperature for 30 min, when TLC (hexane/EtOAc 1 : 1) showed until complete conversion of the starting material (*R*_f = 0.28) into a faster moving compound (*R*_f = 0.82). The reaction mixture was diluted with CH₂Cl₂ (50 mL) and washed with water (3 × 40 mL). The organic layer was dried (MgSO₄) and filtered. The evaporation of the solvent gave an oily residue, which was purified by column chromatography employing hexane/EtOAc (97 : 3 → 90 : 10). The enone **3** was isolated as a syrup (592 mg, 65%). [α]_D²⁸ = +11.5 (*c* = 1.0, CHCl₃). ¹H NMR (500 MHz, CDCl₃): δ = 7.37–7.30 (m, 5H, PhCH₂O), 7.11 (dd, *J*_{3,4} = 10.6, *J*_{4,5} = 1.6 Hz, 1H, 4-H), 6.16 (dd, *J*_{3,4} = 10.6, *J*_{3,5} = 2.4 Hz, 1H, 3-H), 4.95 (s, 1H, 1-H), 4.83 (d, *J* = 11.7, 1H, PhCH₂O), 4.72 (d, *J* = 11.7, 1H, PhCH₂O), 4.53 (m, 1H, 5-H), 3.86 (dd, *J*_{6a,6b} = 10.2, *J*_{5,6a} = 5.6 Hz, 1H, 6a-H), 3.67 (dd, *J*_{6a,6b} = 10.0, *J*_{5,6b} = 7.0 Hz, 1H, 6b-H), 0.91 (s, 9H, Si(CH₃)₂C(CH₃)₃), 0.10, 0.09 (2 s, 6H, Si(CH₃)₂C(CH₃)₃) ppm. ¹³C NMR (125.7 MHz, CDCl₃): δ = 189.0 (C-2), 149.5 (C-4), 136.9, 128.6, 128.2 (×2) (C-aromatic), 125.4 (C-3), 97.1 (C-1), 71.0 (OCH₂Ph), 69.6 (C-5), 64.6 (C-6), 25.9 (Si(CH₃)₂C(CH₃)₃), 18.4 (Si(CH₃)₂C(CH₃)₃), -5.2 (×2) (Si(CH₃)₂C(CH₃)₃) ppm. HRMS (ESI): calcd for C₁₉H₂₈NaO₄Si 371.1649 [M + Na]⁺; found 371.1663.

General procedure for the conjugate addition and NaBH₄ reduction reactions

The corresponding 2*H*-pyran-3(6*H*)-one (0.50 mmol) and thioaldose **4** (182 mg, 0.50 mmol) were dissolved in anhydrous CH₂Cl₂ (1.0 mL) and cooled to -18 °C. A solution of NEt₃ (3.8 μL) in CH₂Cl₂ (0.2 mL) was added, and the mixture was stirred at -18 °C for 1.5 h, when TLC showed complete consumption of the starting materials. The mixture was concentrated and the residue was dissolved in dry MeOH (2.7 mL) and treated with sodium borohydride (21 mg, 0.56 mmol) at 0 °C for 30 min. Then, the mixture was stirred in batch with Dowex 50W (H⁺) resin, filtered, and concentrated. Column chromatography of the residue with pentane/EtOAc (4 : 1 → 1 : 1) afforded the desired thiodisaccharides.

Michael addition of thioaldose **4** to enone **1**

Benzyl 6-*O*-acetyl-3-deoxy-4-*S*-(2,3,4,6-tetra-*O*-acetyl-β-*D*-glucopyranosyl)-4-thio-α-*D*-erythro-hexopyranosid-2-ulose (5) and benzyl 6-*O*-acetyl-3-deoxy-4-*S*-(2,3,4,6-tetra-*O*-acetyl-β-*D*-glucopyranosyl)-4-thio-α-*D*-lyxo-hexopyranoside (7). Column chromatography of the residue afforded first the less polar products (*R*_f = 0.34, pentane/EtOAc, 1 : 1) which were identified as a mixture of non-reduced 2-keto thiodisaccharide **5** and thiodisaccharide **7** (56 mg, 17%, ratio 5 : 7, 0.7 : 1), ¹H NMR (400 MHz, CDCl₃) data for **5**: δ = 7.37–7.30 (m, 5H, PhCH₂O overlapping with PhCH₂O of **7**), 5.19 (t, *J*_{2',3'} = *J*_{3',4'} = 9.3 Hz, 1H, 3'-H), 5.03 (t, *J*_{3',4'} = *J*_{4',5'} = 9.7 Hz, 1H, 4'-H), 4.95 (dd, *J*_{1',2'} = 10.0, *J*_{2',3'} = 9.4 Hz, 2'-H), 4.78 (s, 1H, 1-H), 4.77 (d, *J* = 11.7 Hz, 1H, PhCH₂O), 4.62 (d, *J* = 12.5 Hz, 1H, PhCH₂O), 4.61 (d, *J*_{1',2'} = 9.9 Hz, 1H, 1'-H), 4.52 (dd, *J*_{6a,6b} = 11.7, *J*_{5,6a} = 1.4 Hz, 1H, 6a-H), 4.34 (dd, *J*_{6a,6b} = 12.0, *J*_{5,6b} = 5.3 Hz, 1H, 6b-H), 4.29–4.19 (m, 1H, 5-H overlapping with 6a-H, 6b-H, 6'-a-H of **7**), 4.14 (m, 2H, 6'-a-H, 6'-b-H overlapping with 6'-b-H of **7**), 3.63 (ddd, *J*_{4',5'} = 9.9, *J* = 5.2, *J* = 2.3 Hz, 1H, 5'-H), 3.32 (m, 1H, 4-H overlapping with 4-H of **7**), 2.91 (dd, *J*_{3a,3b} = 15.0, *J*_{2,3a} = 12.0 Hz, 1H, 3a-H), 2.85 (dd, *J*_{3a,3b} = 15.0, *J*_{2,3b} = 6.4 Hz, 1H, 3b-H), 2.11–1.99 (5s, 15H, COCH₃ overlapping with COCH₃ of **7**) ppm. ¹³C NMR (CDCl₃, 100.0 MHz) data for **5**: δ = 198.8 (C-2), 170.7–169.4 (COCH₃ × 5 overlapping with COCH₃ of **7**), 136.3, 128.8, 128.3, 128.1 (C-aromatic), 98.2 (C-1), 83.0 (C-1'), 76.0 (C-5'), 73.7 (C-3'), 70.3 (C-5), 70.2 (C-2'), 70.1 (PhCH₂O), 68.2 (C-4'), 63.7 (C-6), 62.1 (C-6'), 43.4 (C-3), 42.6 (C-4), 20.9–20.7 (COCH₃ × 5 overlapping with COCH₃ of **7**) ppm. HRMS (ESI) data for **5**: calcd for C₂₉H₃₆NaO₁₄S 663.1718 [M + Na]⁺; found 663.1720. ¹H NMR (400 MHz, CDCl₃) data for disaccharide **7**: δ = 7.37–7.30 (m, 5H, PhCH₂O overlapping with PhCH₂O of **5**), 5.23 (t, *J*_{2',3'} = *J*_{3',4'} = 9.3 Hz, 1H, 3'-H), 5.09 (t, *J*_{3',4'} = *J*_{4',5'} = 9.1 Hz, 1H, 4'-H), 5.04 (t, *J*_{1',2'} = *J*_{2',3'} = 9.1 Hz, 1H, 2'-H), 4.85 (br. s, 1H, 1-H), 4.73 (d, *J* = 11.6 Hz, 1H, PhCH₂O), 4.67 (d, *J*_{1',2'} = 10.1 Hz, 1H, 1'-H), 4.50 (d, *J* = 11.6 Hz, 1H, PhCH₂O), 4.42 (m, 1H, 5-H), 4.29–4.19 (m, 3H, 6a-H, 6b-H, 6'-a-H, overlapping with 5-H of **5**), 4.10 (m, 1H, 6'-b-H overlapping with 6'-a-H and 6'-b-H of **5**), 3.70 (m, 2H, 2-H, 5'-H), 3.50 (d, *J*_{OH,2} = 9.9 Hz, 1H, OH) 3.32 (br. s, 1H, 4-H overlapping with 4-H of **5**), 2.29 (m, 2H, 3a-H, 3b-H), 2.11–1.99 (5s, 15H, COCH₃ overlapping with COCH₃ of **5**) ppm. ¹³C NMR (CDCl₃, 100.0 MHz) data for disaccharide **7**: δ = 170.7–169.4 (COCH₃ × 5 overlapping with COCH₃ of **5**), 137.1, 128.7, 128.5, 128.3 (C-

aromatic), 99.9 (C-1), 82.2 (C-1'), 76.3 (C-5'), 73.9 (C-3'), 69.9 (C-2'), 69.2 (PhCH₂O), 68.5 (C-5), 68.2 (C-4'), 67.1 (C-2), 65.3 (C-6), 62.0 (C-6'), 39.1 (C-4), 30.9 (C-3), 20.9–20.7 (COCH₃ × 5 overlapping with COCH₃ of **7**) ppm. HRMS (ESI) data for **7**: calcd for C₂₉H₃₈NaO₁₄S 665.1874 [M + Na]⁺; found 665.1867.

Benzyl 6-*O*-acetyl-3-deoxy-4-*S*-(2,3,4,6-tetra-*O*-acetyl-β-*D*-glucopyranosyl)-4-thio-α-*D*-xylo-hexopyranoside (6). Column chromatography of the residue afforded a second product (*R*_f = 0.23, pentane/EtOAc, 1 : 1), which was identified as thiodisaccharide **6** (135 mg, 37%). ¹H NMR (400 MHz, CDCl₃): δ = 7.38–7.30 (m, 5H, PhCH₂O), 5.20 (t, *J*_{2',3'} = *J*_{3',4'} = 9.3 Hz, 1H, 3'-H), 5.07 (t, *J*_{3',4'} = *J*_{4',5'} = 9.7 Hz, 1H, 4'-H), 5.00 (t, *J*_{1',2'} = *J*_{2',3'} = 9.6 Hz, 1H, 2'-H), 4.91 (d, *J*_{1,2} = 3.5 Hz, 1H, 1-H), 4.76 (d, *J* = 11.5 Hz, 1H, PhCH₂O), 4.58 (d, *J*_{1',2'} = 10.1 Hz, 1H, 1'-H), 4.51 (d, *J* = 11.5 Hz, 1H, PhCH₂O), 4.27 (m, 1H, 5 H), 4.23–4.11 (m, 4H, 6a-H, 6b-H, 6'-a-H, 6'-b-H), 4.06 (m, 1H, 2-H), 3.66 (ddd, *J*_{4',5'} = 9.9, *J*_{5',6'a} = 4.6, *J*_{5',6'b} = 2.4 Hz, 1H, 5'-H), 3.32 (br. s, 1H, 4-H), 2.19 (dt, *J*_{3a,3b} = 12.6, *J*_{2,3a} = *J*_{3a,4} = 3.7 Hz, 1H, 3a-H), 2.09 (m, 1H, 3b-H), 2.07, 2.05 (×2), 2.01, 1.99 (5s, 15H, CH₃CO) ppm. ¹³C NMR (100 MHz, CDCl₃): δ = 170.8, 170.7, 170.2, 169.5 (×2) (COCH₃), 137.0, 128.7, 128.3 (×2) (C-aromatic), 97.2 (C-1), 83.1 (C-1'), 76.1 (C-5'), 74.0 (C-3'), 70.1 (C-2'), 69.5 (PhCH₂O), 68.4 (×2, C-5, C-4'), 65.5 (C-6), 64.4 (C-2), 62.1 (C-6'), 43.2 (C-4), 35.0 (C-3), 20.9, 20.8, 20.7 (×3) (COCH₃) ppm. HRMS (ESI): calcd for C₂₉H₃₈NaO₁₄S 665.1874 [M + Na]⁺; found 665.1875.

Benzyl 6-*O*-acetyl-3-deoxy-4-*S*-(2,3,4,6-tetra-*O*-acetyl-β-*D*-glucopyranosyl)-4-thio-α-*D*-ribo-hexopyranoside (8). Next, the more polar product was isolated (*R*_f = 0.19, pentane/EtOAc, 1 : 1) and identified as thiodisaccharide **8** (66 mg, 18%) and was obtained as a white solid, mp at 113.6 °C (dec.). [α]_D²⁵ = +30.4 (c = 1.0, CHCl₃). ¹H NMR (400 MHz, CDCl₃): δ = 7.38–7.30 (m, 5H, PhCH₂O), 5.18 (t, *J*_{2',3'} = *J*_{3',4'} = 9.3 Hz, 1H, 3'-H), 5.03 (t, *J*_{3',4'} = *J*_{4',5'} = 9.8 Hz, 1H, 4'-H), 4.95 (t, *J*_{1',2'} = *J*_{2',3'} = 9.5 Hz, 1H, 2'-H), 4.93 (d, *J*_{1,2} = 1.8 Hz, 1H, 1-H), 4.75 (d, *J* = 11.7 Hz, 1H, PhCH₂O), 4.58 (d, *J*_{1',2'} = 10.3 Hz, 1H, 1'-H), 4.55 (d, *J* = 11.8 Hz, 1H, PhCH₂O), 4.45 (dd, *J*_{6a,6b} = 11.9, *J*_{5,6a} = 1.3 Hz, 1H, 6a-H), 4.28 (dd, *J*_{6a,6b} = 12.0, *J*_{5,6b} = 5.4 Hz, 1H, 6b-H), 4.16 (dd, *J*_{6'a,6'b} = 12.1, *J*_{5',6'a} = 5.1 Hz, 1H, 6'-a-H), 4.05 (dd, *J*_{6'a,6'b} = 12.4, *J*_{5',6'b} = 1.9 Hz, 1H, 6'-b-H), 3.80 (ddd, *J*_{4,5} = 11.0, *J*_{5,6b} = 5.4, *J*_{5,6a} = 1.4 Hz, 1H, 5-H), 3.75 (m, 1H, 2-H), 3.59 (ddd, *J*_{4',5'} = 9.5, *J*_{5',6'a} = 4.7, *J*_{5',6'b} = 2.0 Hz, 1H, 5'-H), 2.90 (td, *J*_{3b,4} = *J*_{4,5} = 12.8, *J*_{3a,4} = 3.9 Hz, 1H, 4-H), 2.26 (dt, *J*_{3a,3b} = 11.8, *J*_{2,3a} = *J*_{3a,4} = 4.3 Hz, 1H, 3a-H), 2.10, 2.07, 2.03, 2.01, 1.99 (5s, 15H, CH₃CO), 1.88 (q, *J*_{2,3b} = *J*_{3a,3b} = *J*_{3b,4} = 12.3 Hz, 1H, 3b-H) ppm. ¹³C NMR (100 MHz, CDCl₃): δ = 170.7, 170.6, 170.2, 169.4 (×2) (COCH₃), 137.1, 128.7, 128.3, 128.2 (C-aromatic), 97.1 (C-1), 82.8 (C-1'), 75.9 (C-5'), 73.8 (C-3'), 70.2 (C-5), 70.1 (C-2'), 69.7 (PhCH₂O), 68.2 (C-4'), 67.8 (C-2), 64.2 (C-6), 62.1 (C-6'), 39.8 (C-4), 35.9 (C-3), 21.0, 20.8, 20.7 (×3) (COCH₃) ppm. HRMS (ESI): calcd for C₂₉H₃₈NaO₁₄S 665.1874 [M + Na]⁺; found 665.1872.

Michael addition of thioaldose **4** to enone **3**

Benzyl 3-deoxy-6-*O*-(*tert*-butyldimethylsilyl)-4-*S*-(2,3,4,6-tetra-*O*-acetyl-β-*D*-glucopyranosyl)-4-thio-α-*D*-lyxo-hexopyranoside (10) and benzyl 3-deoxy-6-*O*-(*tert*-butyldimethylsilyl)-4-*S*-(2,3,4,6-tetra-*O*-acetyl-β-*D*-glucopyranosyl)-4-thio-α-*D*-ribo-hexopyranoside (11). The first fraction isolated from the column was in fact a mixture of two disaccharides (*R*_f = 0.70, pentane/EtOAc, 1 : 1).

They were identified as **10** and **11** (235 mg, 44%, ratio **10/11** 3.3 : 1.0). ^1H NMR (400 MHz, CDCl_3) data for disaccharide **10**: δ = 7.37–7.28 (m, 5H, PhCH_2O overlapping with PhCH_2O of **11**), 5.23 (t, $J_{2',3'} = J_{3',4'} = 9.3$ Hz, 1H, 3'-H), 5.09 (t, $J_{3',4'} = J_{4',5'} = 9.8$ Hz, 1H, 4'-H), 5.03 (t, $J_{1',2'} = J_{2',3'} = 9.8$ Hz, 1H, 2'-H overlapping with 4'-H of **11**), 4.85 (br. s, 1H, 1-H), 4.76 (d, $J = 11.7$ Hz, 1H, PhCH_2O), 4.71 (d, $J_{1',2'} = 10.0$ Hz, 1H, 1'-H), 4.51 (d, $J = 11.7$ Hz, 1H, PhCH_2O), 4.26 (m, 1H, 5-H), 4.23 (dd, $J_{6'a,6'b} = 12.5$, $J_{5',6'a} = 4.8$ Hz, 1H, 6'-a-H), 4.09 (dd, $J_{6'a,6'b} = 12.4$, $J_{5',6'b} = 2.2$ Hz, 1H, 6'-b-H), 3.76–3.64 (m, 4H, 6a-H, 6b-H, 5'-H, 2-H overlapping with 2-H of **11**), 3.36 (br. d, $J = 2.5$ Hz, 1H, 4-H), 2.26 (m, 2H, 3a-H, 3b-H overlapping with 3a-H of **11**), 2.05–1.98 (4 s, 12H, CH_3CO overlapping with CH_3CO of **11**), 0.88 (s, 9H, $\text{Si}(\text{CH}_3)_2\text{C}(\text{CH}_3)_3$), 0.08, 0.07 (2 s, 6H, $\text{Si}(\text{CH}_3)_2\text{C}(\text{CH}_3)_3$ overlapping with $\text{Si}(\text{CH}_3)_2\text{C}(\text{CH}_3)_3$ of **11**) ppm. ^{13}C NMR (CDCl_3 , 100.0 MHz) data for isomer **10**: δ = 170.6, 170.2, 169.5, 169.4 (CH_3CO), 137.4, 128.6, 128.3, 128.0 (C-aromatic), 100.0 (C-1), 81.6 (C-1'), 76.1 (C-5'), 74.0 (C-3' overlapping with C-3' of **11**), 71.1 (C-5), 70.2 (C-2'), 69.0 (PhCH_2O), 68.3 (C-4'), 67.5 (C-2), 64.3 (C-6), 62.1 (C6'), 38.8 (C-4), 30.2 (C-3), 26.0 ($\text{Si}(\text{CH}_3)_2\text{C}(\text{CH}_3)_3$), 20.8–20.6 (CH_3CO), 18.3 ($\text{Si}(\text{CH}_3)_2\text{C}(\text{CH}_3)_3$), -5.2, -5.3 ($\text{Si}(\text{CH}_3)_2\text{C}(\text{CH}_3)_3$) ppm. ^1H NMR (400 MHz, CDCl_3) data for disaccharide **11**: δ = 7.37–7.28 (m, 5H, PhCH_2O overlapping with PhCH_2O of **10**), 5.15 (t, $J_{2',3'} = J_{3',4'} = 9.3$ Hz, 1H, 3'-H), 5.03 (t, $J_{3',4'} = J_{4',5'} = 9.6$ Hz, 1H, 4'-H overlapping with 2'-H of **10**), 4.93 (dd, $J_{1',2'} = 10.1$, $J_{2',3'} = 9.4$ Hz, 2'-H), 4.89 (d, $J_{1,2} = 3.5$ Hz, 1H, 1-H), 4.76 (d, $J_{1',2'} = 10.2$ Hz, 1H, 1'-H), 4.73 (d, $J = 9.9$ Hz, 1H, PhCH_2O), 4.54 (d, $J = 9.9$ Hz, 1H, PhCH_2O), 4.18 (dd, $J_{6'a,6'b} = 12.4$, $J_{5',6'a} = 5.1$ Hz, 1H, 6'-a-H), 4.05 (dd, $J_{6'a,6'b} = 12.5$, $J_{5',6'b} = 2.1$ Hz, 1H, 6'-b-H), 3.93 (dd, $J_{6a,6b} = 11.5$, $J_{5,6a} = 3.7$ Hz, 1H, 6a-H), 3.79 (dd, $J_{6a,6b} = 11.3$, $J_{5,6a} = 0.8$ Hz, 1H, 6b-H), 3.76–3.64 (m, 1H, 2-H, overlapping with 6a-H, 6b-H, 5'-H, 2 H of **10**), 3.58 (ddd, $J_{4',5'} = 10.0$, $J_{5',6'a} = 5.1$, $J_{5',6'b} = 2.2$ Hz, 1H, 5'-H), 3.52 (br. dd, $J_{4,5} = 10.8$, $J_{5,6b} = 1.9$ Hz, 1H, 5-H), 3.01 (ddd, $J_{3b,4} = 13.5$, $J_{4,5} = 11.1$, $J_{3a,4} = 4.2$ Hz, 1H, 4-H), 2.26 (m, 1H, 3a-H overlapping with 3a-H and 3b-H of **10**), 2.05–1.98 (4 s, 12H, CH_3CO overlapping with CH_3CO of **10**), 1.83 (q, $J_{2,3b} = J_{3a,3b} = J_{3b,4} = 12.4$ Hz, 1H, 3b-H), 0.91 (s, 9H, $\text{Si}(\text{CH}_3)_2\text{C}(\text{CH}_3)_3$), 0.09, 0.07 (2s, 6H, $\text{Si}(\text{CH}_3)_2\text{C}(\text{CH}_3)_3$ overlapping with $\text{Si}(\text{CH}_3)_2\text{C}(\text{CH}_3)_3$ of **10**) ppm. ^{13}C NMR (CDCl_3 , 100.0 MHz) data for isomer **11**: δ = 170.7, 170.2, 169.5, 169.3 (CH_3CO), 137.5, 128.6, 128.1, 128.0 (C-aromatic), 97.2 (C-1), 83.3 (C-1'), 75.8 (C-5'), 74.0 (C-3' overlapping with C-3' of **10**), 73.2 (C-5), 70.4 (C-2'), 69.4 (PhCH_2O), 68.3 (C-4'), 68.1 (C-2), 62.8 (C-6), 62.2 (C6'), 39.1 (C-4), 35.7 (C-3), 26.1 ($\text{Si}(\text{CH}_3)_2\text{C}(\text{CH}_3)_3$), 20.8–20.6 (CH_3CO), 18.5 ($\text{Si}(\text{CH}_3)_2\text{C}(\text{CH}_3)_3$), -4.9, -5.1 ($\text{Si}(\text{CH}_3)_2\text{C}(\text{CH}_3)_3$) ppm. General procedure for the O-acetylation of thiodisaccharides

To a solution of thiodisaccharide (0.16 mmol) in pyridine (1 mL) was added dropwise Ac_2O (1 mL). The reaction was stirred at room temperature for 3 h. Then, the mixture was cooled in an ice/water bath and MeOH was added dropwise (1 mL) and stirred for 30 min. The evaporation of the solvent followed by co-evaporation with toluene (3×1 mL) afforded the desired pure product.

Benzyl 3-deoxy-2,6-di-O-acetyl-4-S-(2,3,4,6-tetra-O-acetyl- β -D-glucopyranosyl)-4-thio- α -D-xylo-hexopyranoside (12). The disaccharide **6** was O-acetylated to afford a **12** (121 mg, 98%) as a white solid, mp at 110 °C (dec.). $R_f = 0.53$ (pentane/EtOAc, 1 : 1). $[\alpha]_{\text{D}}^{25} = +28.5$ ($c = 1.2$, CHCl_3). ^1H NMR (400 MHz, CDCl_3): δ = 7.36–7.29 (m, 5H, PhCH_2O), 5.21 (m, 2H, 2-H, 3'-H), 5.08 (t, $J_{3',4'} = J_{4',5'} = 9.7$ Hz, 1H, 4'-H), 5.01 (t, $J_{1',2'} = J_{2',3'} = 9.6$ Hz, 1H, 2'-H), 5.01 (d, $J_{1,2} = 3.2$ Hz, 1H, 1-H), 4.74 (d, $J = 12.0$ Hz, 1H, PhCH_2O), 4.61 (d, $J_{1',2'} = 10.0$ Hz, 1H, 1'-H), 4.52 (d, $J = 12.0$ Hz, 1H, PhCH_2O), 4.36 (m, 1H, 5-H), 4.21 (dd, $J_{6'a,6'b} = 12.5$, $J_{5',6'a} = 4.6$ Hz, 1H, 6'-a-H), 4.16 (m, 2H, 6a-H, 6b-H), 4.13 (dd, $J_{6'a,6'b} = 12.5$, $J_{5',6'b} = 2.3$ Hz, 1H, 6'-b-H), 3.67 (ddd, $J_{4',5'} = 9.9$, $J_{5',6'a} = 4.4$, $J_{5',6'b} = 2.4$ Hz, 1H, 5'-H), 3.39 (br. d, $J = 2.1$ Hz, 1H, 4-H), 2.34 (td, $J_{2,3a} = J_{3a,3b} = 12.6$, $J_{3a,4} = 3.6$ Hz, 1H, 3a-H), 2.14 (m, 1H, 3b-H), 2.07, 2.06 ($\times 2$), 2.03, 2.01, 1.99 (COCH_3) ppm. ^{13}C NMR (100 MHz, CDCl_3): δ = 170.7, 170.6, 170.2 ($\times 2$), 169.7, 169.4 (COCH_3), 137.3, 128.6, 128.1, 128.0 (C-aromatic), 94.9 (C-1), 82.8 (C-1'), 76.1 (C-5'), 73.9 (C-3'), 70.0 (C-2'), 69.2 (PhCH_2O), 68.3 ($\times 2$, C-4', C-5), 66.9 (C-2), 65.4 (C-6), 62.0 (C-6'), 42.9 (C-4), 30.9 (C-3), 21.1, 20.9, 20.8, 20.7 ($\times 3$) (COCH_3). Desilylation reaction of thiodisaccharide 13

Benzyl 2-O-acetyl-3-deoxy-4-S-(2,3,4,6-tetra-O-acetyl- β -D-glucopyranosyl)-4-thio- α -D-xylo-hexopyranoside (14). To a solution containing thiodisaccharide 13 (276 mg, 0.365 mmol) in THF (12.8 mL) was added dropwise 1 M TBAF in THF (0.44 mL). The mixture was stirred at room temperature for 3 h, then the solvent was evaporated and the residue was dissolved in 50 mL of CH₂Cl₂. The resulting solution was washed with H₂O (2 \times 25 mL), dried (MgSO₄), and filtered. Evaporation of the solvent afforded an oily residue that was purified by column chromatography with hexane/EtOAc (4 : 1 \rightarrow 1 : 1) to give the thiodisaccharide 14 (153 mg, 65%) as a more polar product ($R_f = 0.29$, hexane/EtOAc, 1 : 1), and a white solid, mp at 146 °C (dec.) [$\alpha_D^{28} = +32.9$ ($c = 1.0$, CHCl₃)]. ¹H NMR (500 MHz, CDCl₃): $\delta = 7.35\text{--}7.27$ (m, 5H, PhCH₂O), 5.21 (t, $J_{2',3'} = J_{3',4'} = 9.4$ Hz, 1H, 3'-H), 5.10 (ddd, $J_{2,3a} = 12.0, J_{2,3b} = 4.6, J_{1,2} = 3.8$ Hz, 1H, 2-H), 5.04 (dd, $J_{4',5'} = 10.0, J_{3',4'} = 9.6$ Hz, 1H, 4'-H), 5.00 (dd, $J_{1',2'} = 10.0, J_{2',3'} = 9.4$ Hz, 1H, 2'-H), 4.96 (br. d, $J_{1,2} = 3.6$ Hz, 1H, 1-H), 4.72 (d, $J = 12.2$ Hz, 1H, PhCH₂O), 4.58 (d, $J_{1',2'} = 10.1$ Hz, 1H, 1'-H), 4.54 (d, $J = 12.2$ Hz, 1H, PhCH₂O), 4.18 (m, 1H, 5-H), 4.14 (m, 2H, 6'a-H, 6'b-H), 3.71 (dd, $J_{6a,6b} = 11.6, J_{5,6a} = 7.7$ Hz, 1H, 6a-H), 3.70 (m, 1H, 5'-H), 3.56 (dd, $J_{6a,6b} = 11.6, J_{5,6b} = 6.2$ Hz, 1H, 6b-H), 3.39 (br d, $J = 2.5$ Hz, 1H, 4-H), 2.36 (td, $J_{2,3a} = J_{3a,3b} = 12.4, J_{3a,4} = 3.6$ Hz, 1H, 3a-H), 2.17 (br. td, $J_{3a,3b} = 12.8, J_{2,3b} = J_{2,3a} = 3.8$ Hz, 1H, 3b-H), 2.08, 2.07, 2.03, 2.01, 1.99 (COCH₃) ppm. ¹³C NMR (125.7 MHz, CDCl₃): $\delta = 170.7, 170.2$ ($\times 2$), 169.9, 169.4 (COCH₃), 137.4, 128.5, 128.0 ($\times 2$) (C-aromatic), 95.2 (C-1), 83.8 (C-1'), 76.1 (C-5'), 73.7 (C-3'), 70.2 (C-2'), 69.7 (C-5), 69.6 (PhCH₂O), 68.3 (C-4'), 67.5 (C-2), 62.3 (C-6), 62.1 (C-6'), 43.6 (C-4), 31.3 (C-3), 21.1, 20.8 ($\times 2$), 20.7 ($\times 2$) (COCH₃). HRMS (ESI): calcd for C₂₉H₃₈NaO₁₄S 665.1875 [M + Na]⁺; found 665.1885.

General procedure for the oxidation reaction of S-(1 \rightarrow 4)-thiodisaccharides (12–14) to sulfoxides (15–17)

A solution of *m*CPBA (77%, 32 mg, 0.141 mmol) in 2 mL of dry CH₂Cl₂ was added dropwise to another solution of the thiodisaccharide (0.072 mmol) in 2 mL of ethyl ether at 0 °C. The reaction was allowed to reach room temperature and after 30 min of stirring was diluted with EtOAc (30 mL). To the mixture was added a solution of NaHSO₃ (satd. aq.; 10 mL) and stirred for 30 min. The organic phase was separated and stirred with NaHCO₃ (satd. aq.; 10 mL) for 30 min. The organic extract was washed with NaHCO₃ (satd. aq.; 10 mL) and brine (10 mL), dried (MgSO₄), and filtered. The evaporation of the solvent, followed by co-evaporation with 1 : 1 toluene/EtOH (5 \times 10 mL)

afforded an oily residue that was purified by column chromatography with pentane/EtOAc (3 : 2 \rightarrow 1 : 1) or CH₂Cl₂/EtOAc (8 : 1 \rightarrow 4 : 1), to give the diastereomeric mixture of sulfoxides, which in some cases could be separated.

Oxidation reaction of thiodisaccharide 12 to sulfoxides 15R and 15S

Benzyl 3-deoxy-2,6-di-O-acetyl-4-S-(2,3,4,6-tetra-O-acetyl- β -D-glucopyranosyl)-4-thio- α -D-xylo-hexopyranoside (R,S)-S-oxide (15R,S). The oxidation reaction of the thiodisaccharide 12 gave the diastereomeric mixture of sulfoxides 15R,S that could not be separated by column chromatography. The mixture (42 mg, 74%, ratio *R/S*, 1.4 : 1) showed a single spot by TLC ($R_f = 0.29$, pentane/EtOAc, 1 : 1). The isomer 15R was obtained pure by the procedure described below; but the spectral data described for 15S were obtained from the mixture 15R,S. ¹H NMR (400 MHz, CDCl₃) data for *S* isomer: $\delta = 7.39\text{--}7.30$ (m, 5H, PhCH₂O overlapping with PhCH₂O of 15R), 5.43 (d, $J_{1',2'} = J_{2',3'} = 9.4$ Hz, 1H, 2'-H), 5.28 (t, $J_{2',3'} = J_{3',4'} = 9.2$ Hz, 1H, 3'-H), 5.22 (m, 1H, 2-H), 5.20 (d, $J_{1,2} = 1.6$ Hz, 1H, 1-H), 5.09 (t, $J_{3',4'} = J_{4',5'} = 9.7$ Hz, 1H, 4'-H), 4.74 (d, $J = 11.9$ Hz, 1H, PhCH₂O), 4.55–4.53 (m, 2H, PhCH₂O, 5-H overlapping with 1'-H of 15R), 4.32 (d, $J_{1',2'} = 9.7$ Hz, 1H, 1'-H), 4.26–4.16 (m, 4H, 6a-H, 6b-H, 6'a-H, 6'b-H overlapping with 6'a-H, 6'b-H of 15R), 3.79 (m, 1H, 5'-H overlapping with 5'-H of 15R), 3.45 (m, 1H, 4-H), 2.50 (ddd, $J_{3a,3b} = 13.3, J_{2,3a} = 5.7, J_{3a,4} = 2.6$ Hz, 1H, 3a-H), 2.28 (m, 1H, 3b-H overlapping with 3a-H of 15R), 2.09–2.01 (6 s, 18H, COCH₃ overlapping with COCH₃ and 3b-H of 15R) ppm. ¹³C NMR (CDCl₃, 100.0 MHz) data for *S* isomer: $\delta = 170.7\text{--}168.8$ (CH₃CO), 137.2, 128.6, 128.1, 128.0 (C-aromatic), 95.1 (C-1), 90.4 (C-1'), 77.0 (C-5'), 73.4 (C-3'), 69.9 (OCH₂Ph), 68.6 (C-2'), 67.7 (C-4'), 66.5 (C-2), 66.2 (C-5), 63.7 (C-6), 61.6 (C-6'), 55.0 (C-4), 22.9 (C-3), 21.1–20.6 (COCH₃) ppm. HRMS (ESI): calcd for C₃₁H₄₁O₁₆S 701.2110 [M + H]⁺; found 701.2085.

Benzyl 3-deoxy-2,6-di-O-acetyl-4-S-(2,3,4,6-tetra-O-acetyl- β -D-glucopyranosyl)-4-thio- α -D-xylo-hexopyranoside (R)-S-oxide (15R). Compound 15R was obtained as a single diastereoisomer starting from 16R. Thus, compound 16R (32 mg, 0.041 mmol) dissolved in THF (1.5 mL) and treated with a solution of TBAF 1 M in THF (50 μ L). The mixture was stirred at room temperature for 2.5 h, then the solvent was evaporated and the residue was dissolved in CH₂Cl₂ (50 mL). The resulting solution was washed with H₂O (2 \times 25 mL), dried (Na₂SO₄), and filtered. Evaporation of the solvent afforded a product that exhibited NMR data identical to that of sulfoxide 17R (see below). Acetylation of 17R (acetic anhydride/pyridine 1 : 1, 0.4 mL) at room temperature for 2 h led, after column chromatography, to syrupy 15R (18 mg, 61% from 16R). ¹H NMR (400 MHz, CDCl₃): $\delta = 7.39\text{--}7.30$ (m, 5H, PhCH₂O), 5.47 (t, $J_{1',2'} = J_{2',3'} = 9.5$ Hz, 1H, 2'-H), 5.40 (t, $J_{2',3'} = J_{3',4'} = 9.2$ Hz, 1H, 3'-H), 5.12 (t, $J_{4',5'} = J_{3',4'} = 9.7$ Hz, 1H, 4'-H), 5.08 (d, $J_{1,2} = 3.3$ Hz, 1H, 1-H), 4.82 (d, $J = 11.8$ Hz, 1H, PhCH₂O), 4.70 (dt, $J_{2,3a} = 8.8, J_{1,2} = J_{2,3b} = 3.9$ Hz, 1H, 2-H), 4.66 (m, 1H, 5-H), 4.58 (d, $J = 11.7$ Hz, 1H, PhCH₂O), 4.56 (d, $J_{1',2'} = 9.6$ Hz, 1H, 1'-H), 4.46 (m, 2H, 6a-H, 6b-H), 4.23 (dd, $J_{6'a,6'b} = 12.4, J_{6'a,5'} = 2.3$ Hz, 1H, 6'a-H), 4.17 (dd, $J_{6'a,6'b} = 12.5, J_{6'b,5'} = 5.6$ Hz, 1H, 6'b-H) 3.80 (ddd, $J_{4',5'} = 9.9, J_{6'b,5'} = 5.5,$

$J_{6'a,5'} = 2.3$ Hz, 1H, 5'-H), 3.62 (br. s, 1H, 4-H), 2.34 (td, $J_{2,3a} = J_{3a,3b} = 13.6$, $J_{3a,4} = 3.9$ Hz, 1H, 3a-H), 2.08–2.02 (6 s, 19H, COCH₃, 3b-H) ppm. ¹³C NMR (CDCl₃, 100.0 MHz): $\delta = 170.7$ – 168.8 (CH₃CO), 136.8, 128.7, 128.3, 128.1 (C-aromatic), 94.9 (C-1), 86.8 (C-1'), 77.4 (C-5'), 74.0 (C-3'), 69.4 (OCH₂Ph), 69.2 (C-5), 68.0 (C-4'), 67.1 (C-2), 66.4 (C-2'), 64.7 (C-6), 62.1 (C-6'), 58.8 (C-4), 25.9 (C-3), 21.0–20.6 (COCH₃) ppm.

Oxidation reaction of thiodisaccharide 13 to sulfoxides 16R and 16S

Benzyl 2-O-acetyl-3-deoxy-6-O-(tert-butylidimethylsilyl)-4-S-(2,3,4,6-tetra-O-acetyl- β -D-glucopyranosyl)-4-thio- α -D-xylo-hexopyranoside (R)-S-oxide (16R). The major product of the oxidation of thiodisaccharide 13 was the sulfoxide 16R (50 mg, 59%) obtained as a white solid, mp at 166.2 °C (dec.). $R_f = 0.56$, CH₂Cl₂/EtOAc (4 : 1). $[\alpha]_D^{25} = +25.4$ ($c = 1.0$, CHCl₃). ¹H NMR (500 MHz, CDCl₃): $\delta = 7.39$ – 7.29 (m, 5H, PhCH₂O), 5.46 (t, $J_{1',2'} = J_{2',3'}$ = 9.5 Hz, 1H, 2'-H), 5.40 (t, $J_{2',3'} = J_{3',4'}$ = 9.2 Hz, 1H, 3'-H), 5.10 (dd, $J_{4',5'} = 10.1$, $J_{3',4'} = 9.2$ Hz, 1H, 4'-H), 5.07 (d, $J_{1,2} = 3.5$ Hz, 1H, 1-H), 4.91 (d, $J = 11.9$ Hz, 1H, OCH₂Ph), 4.67 (dt, $J_{2,3b} = 12.7$, $J_{1,2} = J_{2,3a} = 4.0$ Hz, 1H, 2-H), 4.62 (d, $J = 11.9$ Hz, 1H, OCH₂Ph), 4.56 (d, $J_{1',2'} = 9.7$ Hz, 1H, 1'-H), 4.55 (dt, $J_{5,6a} = 8.7$, $J_{4,5} = J_{5,6b} = 1.8$ Hz, 1H, 5-H), 4.21 (dd, $J_{6'a,6'b} = 12.5$, $J_{5',6'a} = 3.0$ Hz, 1H, 6'a-H), 4.18 (dd, $J_{6'a,6'b} = 12.5$, $J_{5',6'b} = 5.6$ Hz, 1H, 6'b-H), 4.02 (dd, $J_{6a,6b} = 11.9$, $J_{5,6a} = 8.9$ Hz, 1H, 6a-H), 3.86 (dd, $J_{6a,6b} = 11.9$, $J_{5,6b} = 2.0$ Hz, 1H, 6b-H), 3.80 (ddd, $J_{4',5'} = 10.1$, $J_{5',6'b} = 5.5$, $J_{5',6'a} = 2.9$ Hz, 1H, 5'-H), 3.53 (br. s, 1H, H-4), 2.36 (td, $J_{2,3a} = J_{3a,3b} = 13.5$, $J_{3a,4} = 4.0$ Hz, 1H, 3a-H), 2.08 ($\times 2$), 2.05, 2.04, 2.02 (5 s, 16H, CH₃CO overlapping with 3b-H), 0.90 (s, 9H, Si(CH₃)₂C(CH₃)₃), 0.09, 0.07 (2 s, 6H, Si(CH₃)₂C(CH₃)₃) ppm. ¹³C NMR (125.7 MHz, CDCl₃): $\delta = 170.8$, 170.5 ($\times 2$), 169.3, 168.9 (COCH₃), 137.1, 128.6, 128.3, 128.1 (C-aromatic), 94.5 (C-1), 86.6 (C-1'), 77.4 (C-5'), 74.1 (C-3'), 72.7 (C-5), 68.7 (OCH₂Ph), 68.0 (C-4'), 67.4 (C-2), 66.4 (C-2'), 64.3 (C-6), 62.2 (C-6'), 59.4 (C-4), 26.2 (C-3), 26.1 (Si(CH₃)₂C(CH₃)₃), 21.1, 20.9, 20.8, 20.7 ($\times 2$) (COCH₃), 18.4 (Si(CH₃)₂C(CH₃)₃), -5.0, -5.2 (Si(CH₃)₂C(CH₃)₃) ppm. HRMS (ESI): calcd for C₃₅H₅₂NaO₁₅SSi 795.2688 [M + Na]⁺; found 795.2699.

Benzyl 2-O-acetyl-3-deoxy-6-O-(tert-butylidimethylsilyl)-4-S-(2,3,4,6-tetra-O-acetyl- β -D-glucopyranosyl)-4-thio- α -D-xylo-hexopyranoside (S)-S-oxide (16S). The minor product of the oxidation of compound 13 was the white solid sulfoxide 16S (31 mg, 37%), mp at 118.1 °C (dec.). $R_f = 0.30$, CH₂Cl₂/EtOAc (4 : 1). $[\alpha]_D^{25} = +31.1$ ($c = 0.7$, CHCl₃). ¹H NMR (500 MHz, CDCl₃): $\delta = 7.38$ – 7.28 (m, 5H, PhCH₂O), 5.49 (t, $J_{1',2'} = J_{2',3'}$ = 9.5 Hz, 1H, 2'-H), 5.28 (t, $J_{2',3'} = J_{3',4'}$ = 9.3 Hz, 1H, 3'-H), 5.20 (d, $J_{1,2} = 2.8$ Hz, 1H, 1-H), 5.18 (m, 1H, 2-H), 5.09 (dd, $J_{4',5'} = 10.0$, $J_{3',4'} = 9.5$ Hz, 1H, 4'-H), 4.72 (d, $J = 12.1$ Hz, 1H, OCH₂Ph), 4.59 (d, $J_{1',2'} = 9.7$ Hz, 1H, 1'-H), 4.56 (d, $J = 12.1$ Hz, 1H, OCH₂Ph), 4.32 (td, $J_{5,6a} = J_{5,6b} = 6.6$, $J_{4,5} = 2.6$ Hz, 1H, 5-H), 4.22 (dd, $J_{6'a,6'b} = 12.6$, $J_{5',6'a} = 4.9$ Hz, 1H, 6'a-H), 4.13 (dd, $J_{6'a,6'b} = 12.6$, $J_{5',6'b} = 2.2$ Hz, 1H, 6'b-H), 3.74 (ddd, $J_{4',5'} = 10.0$, $J_{5',6'a} = 4.9$, $J_{5',6'b} = 2.3$ Hz, 1H, 5'-H), 3.72 (m, 2H, 6a-H, 6b-H), 3.57 (dt, $J_{3b,4} = 5.0$, $J_{3a,4} = J_{4,5} = 2.5$ Hz, 1H, 4-H), 2.40 (ddd, $J_{3a,3b} = 13.2$, $J_{2,3a} = 5.1$, $J_{3a,4} = 2.5$ Hz, 1H, 3a-H), 2.24 (ddd, $J_{3a,3b} = 13.5$, $J_{2,3b} = 11.6$, $J_{3b,4} = 5.4$ Hz, 1H, 3b-H), 2.07, 2.03, 2.02 ($\times 2$), 2.01 (COCH₃), 0.92 (s, 9H, Si(CH₃)₂C(CH₃)₃), 0.10 ($\times 2$) (2s, 6H, Si(CH₃)₂C(CH₃)₃) ppm.

Benzyl 2-O-acetyl-3-deoxy-4-S-(2,3,4,6-tetra-O-acetyl- β -D-glucopyranosyl)-4-thio- α -D-xylo-hexopyranoside (R)-S-oxide (17R).

The product of the oxidation of thiodisaccharide 14 was the sulfoxide 17R (43 mg, 80%) obtained as a white solid, mp at 158.1 °C (dec.). $R_f = 0.34$, pentane/EtOAc (3 : 1). $[\alpha]_D^{22} = +4.0$ ($c = 0.8$, CHCl₃). ¹H NMR (400 MHz, CDCl₃): $\delta = 7.37$ – 7.29 (m, 5H, PhCH₂O), 5.50 (t, $J_{1',2'} = J_{2',3'}$ = 9.5 Hz, 1H, 2'-H), 5.41 (t, $J_{2',3'} = J_{3',4'}$ = 9.3 Hz, 1H, 3'-H), 5.12 (t, $J_{3',4'} = J_{4',5'}$ = 9.7 Hz, 1H, 4'-H), 5.04 (d, $J_{1,2} = 3.1$ Hz, 1H, 1-H), 4.77 (d, $J = 12.1$ Hz, 1H, PhCH₂O), 4.65 (d, $J = 12.2$ Hz, 1H, PhCH₂O), 4.61 (d, $J_{1',2'} = 9.7$ Hz, 1H, 1'-H), 4.60 (m, 1H, 2-H), 4.50 (m, 1H, 5-H), 4.24 (dd, $J_{6'a,6'b} = 12.3$, $J_{5',6'a} = 1.3$ Hz, 1H, 6'a-H), 4.16 (dd, $J_{6'a,6'b} = 12.4$, $J_{5',6'b} = 5.6$ Hz, 1H, 6'b-H), 3.81 (m, 2H, 6a-H, 5'-H), 3.74 (m, 2H, 4-H, 6b-H), 2.37 (td, $J_{3a,3b} = 13.9$, $J_{2,3a} = 3.8$ Hz, 1H, 3a-H), 2.08 ($\times 2$), 2.06, 2.04, 2.02 (5 s, 16H, CH₃CO overlapping with 3b-H). ¹³C NMR (CDCl₃, 100.0 MHz) $\delta = 170.8$, 170.5, 170.4, 169.3, 168.9 (COCH₃), 137.1, 128.7, 128.3, 128.2 (C-aromatic), 95.3 (C-1), 86.5 (C-1'), 77.4 (C-5'), 74.0 (C-3'), 70.3 (PhCH₂O), 69.5 (C-5), 68.0 (C-4'), 67.7 (C-2), 66.2 (C-2'), 62.0 (C-6), 61.8 (C-6'), 58.9 (C-4), 25.4 (C-3), 21.1, 20.8, 20.7 ($\times 2$), 20.6 (COCH₃) ppm. HRMS (ESI): calcd for C₂₉H₃₈NaO₁₅S 681.1824 [M + Na]⁺; found 681.1830.

Benzyl 3-deoxy-4-S-(β -D-glucopyranosyl)-4-thio- α -D-xylo-hexopyranoside (R)-S-oxide (18R).

A solution of the thiodisaccharide S-oxide 17R (49 mg, 0.074 mmol) in MeOH/Et₃N/H₂O (4 : 1 : 5; 0.46 mL) was stirred at room temperature for 3 h. The mixture was concentrated, and the resulting residue was dissolved in water (1 mL) and eluted through a column filled with a Dowex MR-3C mixed-bed ion-exchange resin. The deionized solution was concentrated, and the unprotected compound was purified by dissolution in water (1 mL) and filtration through an octadecyl C18 minicolumn (Amprep, Amersham Biosciences). Evaporation of the water gave the unprotected thiodisaccharide S-oxides as colourless syrupy that was identified as 18R (31 mg, 93%). $R_f = 0.72$, BuOH/EtOH/H₂O (10 : 4 : 4). $[\alpha]_D^{23} = +32.3$ ($c = 1.0$, MeOH). ¹H NMR (400 MHz, D₂O) $\delta = 7.51$ – 7.40 (m, 5H, PhCH₂O), 5.10 (d, $J_{1,2} = 3.3$ Hz, 1H, 1-H), 4.88 (d, $J = 11.6$ Hz, 1H, PhCH₂O), 4.69 (d, $J = 11.7$ Hz, 1H, PhCH₂O), 4.56 (m, 1H, 5-H), 4.50 (d, $J_{1',2'} = 9.2$ Hz, 1H, 1'-H), 3.96–3.89 (m, 3H, 2-H, 6'a-H, 6'b-H), 3.84 (m, 2H, 4-H, 6a-H), 3.76 (m, 2H, 6b-H, 2'-H), 3.69 (t, $J_{2',3'} = J_{3',4'} = 8.8$ Hz, 1H, 3'-H), 3.66 (m, 1H, 5'-H), 3.50 (t, $J_{3',4'} = J_{4',5'} = 9.3$ Hz, 1H, 4'-H), 2.30 (td, $J_{2,3a} = J_{3a,3b} = 14.3$, $J_{3a,4} = 3.9$ Hz, 1H, 3a-H) 1.96 (br dt, $J_{3a,3b} = 14.2$, $J_{2,3b} = J_{3b,4} = 3.5$ Hz, 1H, 3b-H) ppm. ¹³C NMR (CDCl₃, 100.0 MHz) $\delta = 136.9$, 128.8, 128.6, 128.4 (C-aromatic), 97.1 (C-1), 87.2 (C-1'), 80.5 (C-5'), 76.8 (C-3'), 71.2 (C-5), 69.6 (PhCH₂O), 68.6 (C-4'), 67.2 (C-2'), 63.6 (C-2), 62.0 (C-6), 60.5 (C-6'), 56.7 (C-4), 27.9 (C-3) ppm. HRMS (ESI): calcd for C₁₉H₂₈NaO₁₀S 471.1295 [M + Na]⁺; found 471.1275.
