## Metal-free C–H arylation of imidazoheterocycles with aryl hydrazines†

Sourav Jana,<sup>a</sup> Sadhanendu Samanta,<sup>a</sup> Avik K. Bagdi,<sup>b</sup> Valerii Z. Shirinian<sup>c</sup> and Alakananda Hajra<sup>a\*</sup>

A simple and efficient metal-free arylation of imidazo[1,2-*a*]pyridines at the C-3 position with arylhydrazine has been achieved at room temperature under ambient air conditions. Various 2,3-disubstituted imidazopyridines and imidazothiazoles were synthesized with high yields. The present methodology demonstrates the usefulness of commercially available aryl hydrazine as an arylating agent.

### Introduction

The development of efficient methodologies for the arylation of biological active heterocycles has been of great importance over the years.<sup>1</sup> Traditionally, arylation is achieved *via* transition-metal-catalyzed cross-coupling reactions.<sup>2</sup> In the last decade, transition-metal-catalyzed direct C–H arylation has emerged as an alternative to the conventional cross-coupling reaction.<sup>3</sup> However, use of a metal catalyst, ligand, and additives limits the application of these methodologies. As such, it is desirable to develop transition-metal-free methods for the arylation of bioactive heterocycles.<sup>4</sup> Arylhydrazine has recently been used as an arylating agent due to its ready availability.<sup>5</sup> Few methodologies have been developed using arylhydrazine for the arylation of various heterocycles.<sup>5b,d,f,i,j</sup>

Imidazo[1,2-*a*]pyridine has attracted much interest due to its wide range of applications in pharmaceuticals and material science.<sup>6</sup> The pharmacological activity of this moiety is dependent on its substituents. Several bioactive compounds such as  $\gamma$ -secretase modulators (GSMs) (1), liver X receptor (LXR) agonists (2), positive allosteric modulators (PAMs) of metabotropic glutamate 2 receptor (3), GABA<sub>A</sub> $\alpha$ 2/ $\alpha$ 3 agonists (4), anti-leishmanial agents (5 and 6), and kinase inhibitors (7) contain the arylimidazo[1,2-*a*]pyridine moiety as the core structure (Fig. 1).<sup>7</sup> As a consequence, a number of methodologies have been developed for the synthesis and functionalization of this moiety.<sup>8</sup> Conventionally, arylation of imidazo[1,2-*a*]pyridine is carried out by transition-metal-catalyzed cross-coupling

reactions using aryl halide/tosylate/mesylate as the aryl source.<sup>9</sup> Despite these advances in the functionalization of this moiety, to the best of our knowledge, there is no metal-free protocol for the arylation of imidazo[1,2-*a*]pyridines. This prompted us to develop a transition-metal-free method for the arylation of imidazo[1,2-*a*]pyridines. Herein, we report a direct C–H arylation of imidazo[1,2-*a*]pyridines using easily accessible arylhydrazine hydrochloride in the presence of 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) at room temperature under ambient air (Scheme 1).

### Results and discussion

We commenced our study by taking 2-phenylimidazo[1,2-*a*]pyridine (1a) and phenyl hydrazine hydrochloride (2a) as the model substrates for the arylation of imidazopyridines. Initially we carried out the reaction using Et<sub>3</sub>N (4 equiv.) as a base in MeCN. Gratifyingly, the expected 2,3-diphenyl imidazo[1,2-*a*]

Scheme 1 Arylation of imidazopyridines.

pyridine was obtained in 56% yield within 4 h (Table 1, entry 1). On screening with other organic bases such as Et<sub>3</sub>NH, <sup>i</sup>Pr<sub>2</sub>NH, DBU and 1,4-diazabicyclo[2.2.2]octane (DABCO), it was found that DBU was the optimal base, affording the desired product in 83% yield (Table 1, entries 2–5). Inorganic bases (K<sub>2</sub>CO<sub>3</sub>, Cs<sub>2</sub>CO<sub>3</sub>, K<sub>3</sub>PO<sub>4</sub> and KO<sup>t</sup>Bu) were also tested, but none were as effective (Table 1, entries 6–9). Other solvents including dimethyl sulfoxide (DMSO), dimethyl formamide (DMF), dimethyl acetamide (DMA), MeNO<sub>2</sub>, dichloroethane (DCE), H<sub>2</sub>O, MeOH and EtOH were not as effective as MeCN (Table 1, entries 10–17). Increment of base loading did not improve the yield, whereas decrement of base loading diminished the yield significantly (Table 1, entries 18 and 19). The reaction did not occur in the absence of base, which suggests a significant role for the base in this arylation reaction (Table

1, entry 20). When the reaction was carried in an oxygen atmosphere, no further improvement in yield was observed (Table 1, entry 21); however, in an inert atmosphere, only a trace amount of the product was obtained (Table 1, entry 22). Thus, the optimum yield was obtained by carrying out the reaction using 4 equiv. of DBU in MeCN in ambient air (Table 1, entry 4).

After establishing the optimized reaction conditions, we investigated the substrate scope of this arylation reaction. For this purpose, the effect of the substituent present at the 2-position on the imidazo[1,2-*a*]pyridine moiety was first tested (Scheme 2). Imidazo[1,2-*a*]pyridines bearing a phenyl ring with electron-donating as well as electron-withdrawing functionality afforded the desired products with excellent yields (3aa–3ia). The commercially available drug, zolimidine, was also arylated under the present reaction conditions with 87% yield (3ja). 2-Naphthyl imidazo[1,2-*a*]pyridine and 2-thiophenyl imidazo[1,2-*a*]pyridine also yielded the corresponding products (3ka and 3la). Imidazo[1,2-*a*]pyridine containing an aliphatic substituent at the 2-position effectively reacted with phenyl hydrazine to generate the desired product (3ma). Moreover, unsubstituted imidazo[1,2-*a*]pyridine afforded the regioselectively 3-arylated product with good yield (3na).

Table 1 Optimization of the reaction conditions<sup>a</sup>

Entry	Base (equiv.)	Time	Solvent	Yield <sup>b</sup>
1	Et <sub>3</sub> N (4)	4 h	MeCN	56%
2	Et <sub>2</sub> NH (4)	4 h	MeCN	45%
3	<sup>i</sup> Pr <sub>2</sub> NH (4)	4 h	MeCN	35%
4	DBU (4)	4 h	MeCN	83%
5	DABCO (4)	4 h	MeCN	48%
6	K <sub>2</sub> CO <sub>3</sub> (4)	4 h	MeCN	45%
7	Cs <sub>2</sub> CO <sub>3</sub> (4)	4 h	MeCN	48%
8	K <sub>3</sub> PO <sub>4</sub> (4)	4 h	MeCN	39%
9	KO <sup>t</sup> Bu (4)	4 h	MeCN	51%
10	DBU (4)	4 h	DMSO	60%
11	DBU (4)	4 h	DMF	40%
12	DBU (4)	4 h	DMA	30%
13	DBU (4)	4 h	MeNO <sub>2</sub>	Trace
14	DBU (4)	4 h	DCE	22%

<sup>a</sup> Reaction conditions: 0.2 mmol of **1a**, 1.3 equiv. of **2a** and base in 3 mL solvent at rt. <sup>b</sup> Isolated yield. <sup>c</sup> NR = no reaction. <sup>d</sup> O<sub>2</sub> atmosphere. <sup>e</sup> Ar atmosphere.

Scheme 2 Scope of substrates: variation of C-2 substituents on the imidazo[1,2-*a*]pyridine. Reaction conditions: 0.2 mmol of **1**, 1.3 equiv. of **2a** and 4 equiv. of DBU in 3 mL MeCN at rt (27 °C) for 4 h. <sup>a</sup>Reaction completed in 12 h. <sup>b</sup>Reaction completed in 9 h.

However, 3-phenylimidazo[1,2-*a*]pyridine did not react under the present reaction conditions. It should also be mentioned that 2,3-diphenylimidazo[1,2-*a*]pyridine (**3aa**) and 2-(4-methoxyphenyl)-3-phenylimidazo[1,2-*a*]pyridine (**3ca**) are known as potent antileishmanial agents.<sup>7d</sup>

Next, the effect of the substituent on the pyridine ring of the imidazo[1,2-*a*]pyridine moiety was tested (Scheme 3). Imidazo[1,2-*a*]pyridines bearing different substituents such as –Me, –Cl, –Br and –CN on the pyridine rings successfully afforded the corresponding arylated products with high to excellent yields (**3oa–3ta**). The structure of 8-methyl-2,3-diphenylimidazo[1,2-*a*]pyridine (**3oa**) was confirmed by single crystal X-ray crystallography analysis.<sup>10</sup> Applicability of the present methodology was also demonstrated

**Scheme 3** Scope of substrates: variation of substituents on imidazo[1,2-*a*]pyridine at pyridine rings: reaction conditions: 0.2 mmol of **1**, 1.3 equiv. of **2a** and 4 equiv. of DBU in 3.0 mL MeCN at rt (27 °C) for 4 h.  
<sup>a</sup> Reaction at 5.0 mmol scale.

**Scheme 4** Scope of substrates: variation of substituents on arylhydrazine: reaction conditions: 0.2 mmol of **1a**, 1.3 equiv. of **2** and 4 equiv. of DBU in 3.0 mL MeCN at rt (27 °C) for 4 h.

on a gram scale. 6-Bromo-2,3-diphenylimidazo[1,2-*a*]pyridine reacted efficiently with phenyl hydrazine to afford the product **3ra** without significant decrement of the yield (77%).

To assess the general applicability of the protocol, different arylhydrazine hydrochlorides were also reacted with 2-phenylimidazo[1,2-*a*]pyridine, as shown in Scheme 4. Different arylhydrazines bearing substituents such as –Me, –Cl, –Br afforded the corresponding arylated products (**3ab–3ae**) with good to excellent yields. However, arylhydrazines with strong electron-withdrawing groups such as –NO<sub>2</sub> and –CN were unable to produce the desired products under the present reaction conditions.

Next, the applicability of this arylation method was extended to other imidazoheterocycles such as imidazo[1,2-*a*]thiazole and benzo[*d*]imidazo[2,1-*b*]thiazole (Scheme 5). Gratifyingly, this methodology successfully afforded the corresponding arylated products (**4a** and **4b**) without any difficulties.

The synthesized product was further functionalized employing Sonogashira and Suzuki coupling reactions (Scheme 6).<sup>8c</sup> 6-Bromo-2,3-diphenylimidazo[1,2-*a*]pyridine (**3ra**) was reacted with ethynylbenzene (Scheme 6, eqn A) to afford 2,3-diphenyl-6-(phenylethynyl)imidazo[1,2-*a*]pyridine (**5**) in excellent yield (95%). 2,3,6-Triphenylimidazo[1,2-*a*]pyridine (**6**) was synthesized in good yield (75%) *via* a Suzuki reaction between 6-bromo-2,3-

**Scheme 5** Substrate scope of imidazo[2,1-*b*]thiazole: reaction conditions: 0.2 mmol of imidazo[1,2-*a*]thiazole, 1.3 equiv. of **2** and 4 equiv. of DBU in 3.0 mL MeCN at rt (27 °C) for 4 h.

**Scheme 6** Synthetic application: reaction conditions (A): 0.2 mmol of **3ra** and 0.2 mmol of phenyl acetylene with 10 mol% PdCl<sub>2</sub>(PPh<sub>3</sub>)<sub>2</sub> and 10 mol% CuI dissolved in 2 mL Et<sub>3</sub>N/DMF (1 : 1) under Ar atmosphere at 50 °C for 24 h. Reaction conditions (B): 0.2 mmol of **3ra** and 1 equiv. of phenyl boronic acid with 2 mol% Pd(PPh<sub>3</sub>)<sub>4</sub> and 2.1 equiv. of K<sub>2</sub>CO<sub>3</sub> in 2 mL DMF/H<sub>2</sub>O (2 : 1) under Ar atmosphere at 100 °C for 4 h.

diphenylimidazo[1,2-*a*]pyridine (**3ra**) and phenyl boronic acid (Scheme 6, eqn B).

A number of control experiments were performed to investigate the reaction pathway. The reactions were carried out in the presence of radical scavengers such as 2,2,6,6-tetramethylpiperidine-1-oxyl (TEMPO) and benzo-1,4-quinone (BQ). The formation of a trace amount only of the products indicates that the reaction probably proceeds through a radical pathway (Scheme 7, eqn (A)). Furthermore, the formation of a trace amount of the product in an argon atmosphere suggests that aerial oxygen plays a vital role in this reaction (Scheme 7, eqn (B)).

On the basis of the control experiments and literature reports,<sup>5b,f,i</sup> the probable mechanism of the reaction is outlined in Scheme 8. Initially the phenyl radical is formed from the phenyl hydrazine in the presence of base under aerobic conditions. The generated phenyl radical reacts with the imidazo[1,2-*a*]pyridine moiety to afford the radical intermediate A. Intermediate A is oxidized into the intermediate B under aerobic conditions. Finally, the product is obtained from the intermediate B *via* elimination of a proton.

Scheme 7 Control experiments.

Scheme 8 Plausible reaction pathway.

## Conclusions

In summary, we have developed a metal-free convenient methodology for the arylation of imidazo[1,2-*a*]pyridines employing arylhydrazine as an arylating agent at room temperature. The present methodology offers a practical route for the synthesis of various 2,3-disubstituted imidazo[1,2-*a*]pyridines with a wide range of functional groups. Imidazo[2,1-*b*]thiazole and benzo[*d*]imidazo[2,1-*b*]thiazole were also arylated under the present reaction conditions in good yields. We believe our present protocol for arylation will find useful applications in organic synthesis, the pharmaceutical industry, and material science.

## Experimental section

### General information

Reagents were purchased from commercial sources and used without further purification.  $^1\text{H}$  and  $^{13}\text{C}\{^1\text{H}\}$  nuclear magnetic resonance (NMR) spectra were determined on a 400 MHz spectrometer.  $^1\text{H}$  NMR spectra were determined on a 400 MHz spectrometer as solutions in  $\text{CDCl}_3$ . Chemical shifts are expressed in parts per million ( $\delta$ ) and the signals are reported as s (singlet), d (doublet), t (triplet), m (multiplet), dd (doublet), and coupling constants ( $J$ ) are given in Hz.  $^{13}\text{C}\{^1\text{H}\}$  NMR spectra were recorded at 100 MHz in  $\text{CDCl}_3$  solution. Chemical shifts as internal standard are referenced to  $\text{CDCl}_3$  ( $\delta = 7.26$  for  $^1\text{H}$  and  $\delta = 77.16$  for  $^{13}\text{C}\{^1\text{H}\}$  NMR) as the internal standard. Thin layer chromatography (TLC) was performed on a silica gel-coated glass slide. Commercially available solvents were freshly distilled before the reaction. All reactions involving moisture-sensitive reactants were executed using oven-dried glassware. X-ray single crystal data were collected using  $\text{MoK}\alpha$  ( $\lambda = 0.71073 \text{ \AA}$ ) radiation with Charged Coupled Device (CCD) area. All the imidazoheterocycles were prepared by our reported methods.<sup>8e,f</sup>

### General experimental procedure for the arylation of imidazo[1,2-*a*]pyridines (3)

A mixture of imidazo[1,2-*a*]pyridine (**1**, 0.20 mmol, 1 equiv.) and arylhydrazine hydrochloride (**2**, 0.26 mmol, 1.3 equiv.) was dissolved in 3 mL MeCN at room temperature (rt) in a reaction tube. Then, 4 equiv. of DBU (120  $\mu\text{L}$ ) was added to the reaction mixture and stirred in air for 4 h unless otherwise mentioned. After completion of the reaction, the reaction mixture was extracted with ethyl acetate and washed with water. The organic phase was dried over anhydrous  $\text{Na}_2\text{SO}_4$ . The crude residue was obtained after evaporating the solvent under reduced pressure and was finally purified by column chromatography on silica gel (60–120 mesh) using petroleum ether and ethylacetate as an eluent to afford the pure product.

**8-Bromo-2,3-diphenylimidazo[1,2-*a*]pyridine (3ta).** White solid (48 mg, 69%), mp: 164–167 °C;  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz):  $\delta$  7.93 (dd,  $J$  = 6.8 Hz, 0.8 Hz, 1H), 7.70–7.67 (m, 2H), 7.55–7.42 (m, 7H), 7.30–7.26 (m, 2H), 6.62 (t,  $J$  = 7.2 Hz, 1H);  $^{13}\text{C}\{^1\text{H}\}$  NMR ( $\text{CDCl}_3$ , 100 MHz):  $\delta$  152.7, 146.9, 134.0, 133.8, 130.8, 129.7, 129.3, 128.53, 128.50, 128.4, 127.8, 127.1, 122.8, 113.0, 112.3; anal. calcd for  $\text{C}_{19}\text{H}_{13}\text{BrN}_2$ : C, 65.35; H, 3.75; N, 8.02; found C, 65.49; H, 3.68; N, 7.94%.

**2-Phenyl-3-(*o*-tolyl)imidazo[1,2-*a*]pyridine (3ab).**<sup>7e</sup> White solid (51 mg, 89%), mp: 124–126 °C (lit. 124–126 °C);  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz):  $\delta$  7.71–7.65 (m, 3H), 7.56 (d,  $J$  = 6.8 Hz, 1H), 7.45–7.43 (m, 2H), 7.36–7.34 (m, 2H), 7.26–7.18 (m, 4H), 6.74–6.70 (m, 1H), 2.01 (s, 3H);  $^{13}\text{C}\{^1\text{H}\}$  NMR ( $\text{CDCl}_3$ , 100 MHz):  $\delta$  144.9, 139.3, 132.4, 131.9, 131.1, 129.8, 129.3, 129.0, 128.5, 127.5, 127.3, 127.1, 124.6, 123.5, 120.1, 117.5, 112.3, 19.5.

**3-(4-Chlorophenyl)-2-phenylimidazo[1,2-*a*]pyridine (3ac).**<sup>7f</sup> White solid (52 mg, 86%), mp: 171–173 °C (lit. 173–175 °C);  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz):  $\delta$  7.94 (d,  $J$  = 7.2 Hz, 1H), 7.68 (d,  $J$  = 9.2 Hz, 1H), 7.64–7.62 (m, 2H), 7.50 (d,  $J$  = 8.4 Hz, 2H), 7.39 (d,  $J$  = 8.8 Hz, 2H), 7.32–7.20 (m, 4H), 6.76 (t,  $J$  = 6.8 Hz, 1H);  $^{13}\text{C}\{^1\text{H}\}$

NMR ( $\text{CDCl}_3$ , 100 MHz):  $\delta$  145.1, 142.9, 135.0, 133.9, 132.1, 130.0, 129.4, 128.5, 128.3, 127.8, 125.1, 123.2, 117.7, 117.1, 112.7.

**3-(2,4-Dichlorophenyl)-2-phenylimidazo[1,2-*a*]pyridine (3ad).** Yellow liquid (55 mg, 81%);  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz):  $\delta$  7.72 (d,  $J$  = 8.8 Hz, 1H), 7.67 (d,  $J$  = 2.0 Hz, 1H), 7.61–7.59 (m, 3H), 7.37 (dd,  $J$  = 8.0 Hz, 2.0 Hz, 1H), 7.32–7.26 (m, 5H), 6.79 (t,  $J$  = 6.8 Hz, 1H);  $^{13}\text{C}\{^1\text{H}\}$  NMR ( $\text{CDCl}_3$ , 100 MHz):  $\delta$  145.3, 143.7, 136.9, 136.5, 134.8, 133.8, 130.5, 129.0, 128.6, 128.4, 127.9, 127.8, 125.2, 123.8, 117.7, 114.7, 112.6; anal. calcd for  $\text{C}_{19}\text{H}_{12}\text{Cl}_2\text{N}_2$ : C, 67.27; H, 3.57; N, 8.26; found C, 67.54; H, 3.58; N, 8.09%.

**3-(2-Bromophenyl)-2-phenylimidazo[1,2-*a*]pyridine (3ae).** Semi solid (59 mg, 85%);  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz):  $\delta$  7.84 (d,  $J$  = 7.2 Hz, 1H), 7.72 (d,  $J$  = 8.8 Hz, 1H), 7.64–7.58 (m, 3H), 7.46–7.36 (m, 3H), 7.30–7.22 (m, 4H), 6.79–6.76 (m, 1H);  $^{13}\text{C}\{^1\text{H}\}$  NMR ( $\text{CDCl}_3$ , 100 MHz):  $\delta$  145.0, 143.0, 134.2, 134.1, 133.7, 131.4, 131.2, 128.56, 128.51, 128.0, 127.7, 126.5, 125.0, 124.0, 120.2, 117.6, 112.3; anal. calcd for  $\text{C}_{19}\text{H}_{13}\text{BrN}_2$ : C, 65.35; H, 3.75; N, 8.02; found C, 65.11; H, 3.83; N, 8.14%.

**General experimental procedure for the arylation of imidazo[2,1-*b*]thiazole (4a and 4b).** A mixture of imidazo[2,1-*b*]thiazole (0.20 mmol, 1 equiv.) and arylhydrazine hydrochloride (2, 0.26 mmol, 1.3 equiv.) was dissolved in 3 mL MeCN at room temperature in a reaction tube. Then 4 equiv. of DBU (120  $\mu\text{L}$ ) was added to the reaction mixture and stirred in air for 4 h. After completion of the reaction, the reaction mixture was extracted with ethyl acetate and washed with water (3 times). The organic phase was evaporated, and crude product was purified by column chromatography on silica gel (60–120 mesh) using petroleum ether and ethylacetate as an eluent to afford the pure product.

**5,6-Diphenylimidazo[2,1-*b*]thiazole (4a).** Yellow liquid (44 mg, 80%);  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz):  $\delta$  7.62–7.59 (m, 2H), 7.46–7.43 (m, 4H), 7.42–7.40 (m, 1H), 7.37 (d,  $J$  = 4.4 Hz, 1H), 7.29–7.27 (m, 2H), 7.24–7.20 (m, 1H), 6.81 (d,  $J$  = 4.8 Hz, 1H);  $^{13}\text{C}\{^1\text{H}\}$  NMR ( $\text{CDCl}_3$ , 100 MHz):  $\delta$  149.1, 134.6, 130.6, 129.38, 129.35, 128.49, 128.43, 127.7, 127.2, 117.6, 112.5; anal. calcd for  $\text{C}_{17}\text{H}_{12}\text{N}_2\text{S}$ : C, 73.89; H, 4.38; N, 10.14; found C, 73.98; H, 4.31; N, 10.13%.

**6-Methoxy-2-phenyl-3-(*o*-tolyl)benzo[*d*]imidazo[2,1-*b*]thiazole (4b).** Semi solid (61 mg, 82%);  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz):  $\delta$  7.56–7.54 (m, 2H), 7.52–7.48 (m, 1H), 7.43 (dd,  $J$  = 7.6 Hz, 1.6 Hz, 2H), 7.36 (t,  $J$  = 8.0 Hz, 1H), 7.25–7.16 (m, 4H), 6.68 (dd,  $J$  = 8.8 Hz, 2.4 Hz, 1H), 6.47 (d,  $J$  = 9.2 Hz, 1H), 3.80 (s, 3H), 2.12 (s, 3H);  $^{13}\text{C}\{^1\text{H}\}$  NMR ( $\text{CDCl}_3$ , 100 MHz):  $\delta$  156.9, 146.5, 142.5, 139.4, 134.6, 131.9, 130.8, 130.1, 130.0, 128.4, 127.3, 127.2, 127.0, 126.9, 126.1, 123.2, 113.3, 113.1, 108.8, 55.9, 19.9; HRMS (ESI-TOF)  $m/z$ :  $[\text{M} + \text{H}]^+$  calcd for  $\text{C}_{23}\text{H}_{19}\text{N}_2\text{OS}$ : 371.1213; found: 371.1203.

**Experimental procedure for the synthesis of 2,3-diphenyl-6-(phenylethynyl)imidazo[1,2-*a*]pyridine (5).** A mixture of 6-bromo-2,3-diphenylimidazo[1,2-*a*]pyridine (3ra, 0.2 mmol, 70 mg), phenylacetylene (0.2 mmol, 22  $\mu\text{L}$ ), bis(triphenylphosphine) palladium(II) dichloride (10 mol%, 14 mg) and copper iodide (10 mol%, 3.8 mg) was taken in a reaction vessel in 2 mL of a solution of DMF/ $\text{Et}_3\text{N}$  (1/1, v/v) under argon and it was stirred at 50 °C temperature for 24 h. After cooling, the reaction mixture was

extracted with ethyl acetate. The organic layer was evaporated, and crude product was purified by column chromatography on silica gel (60–120 mesh) using petroleum ether and ethylacetate as an eluent to afford the pure product. Pure product was obtained as a white solid (70 mg, 95%), mp: 189–191 °C;  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz):  $\delta$  8.13 (m, 1H), 7.68–7.63 (m, 3H), 7.57–7.44 (m, 7H), 7.36–7.24 (m, 7H);  $^{13}\text{C}\{^1\text{H}\}$  NMR ( $\text{CDCl}_3$ , 100 MHz):  $\delta$  143.7, 143.3, 133.9, 131.6, 130.9, 129.8, 129.4, 129.3, 128.7, 128.5, 128.4, 128.1, 127.8, 127.7, 126.2, 122.6, 121.4, 117.3, 109.2, 90.6, 85.8; anal. calcd for  $\text{C}_{27}\text{H}_{18}\text{N}_2$ : C, 87.54; H, 4.90; N, 7.56; found C, 87.84; H, 4.72; N, 7.44%.

**Experimental procedure for the synthesis of 2,3,6-triphenylimidazo[1,2-*a*]pyridine (6).** A mixture of 6-bromo-2,3-diphenylimidazo[1,2-*a*]pyridine (3a, 0.2 mmol, 70 mg), phenyl boronic acid (0.2 mmol, 24 mg), tetrakis(triphenylphosphine) palladium(0) (2 mol%, 4.6 mg) and potassium carbonate (2.1 equiv. 58 mg) was taken in a reaction vessel in 2 mL of a solution of DMF/ $\text{H}_2\text{O}$  (2/1, v/v) under argon and it was stirred at 100 °C temperature for 4 h. After completion of the reaction, the reaction mixture was cooled to room temperature, quenched with water, and extracted with dichloromethane. The organic layer was evaporated, and crude product was purified by column chromatography on silica gel (60–120 mesh) using petroleum ether and ethylacetate as an eluent to afford the pure product. Pure product was obtained as a white solid (52 mg, 75%), mp: 165–167 °C;  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz):  $\delta$  8.11 (s, 1H), 7.75 (d,  $J$  = 9.6 Hz, 1H), 7.69–7.67 (m, 2H), 7.56–7.46 (m, 8H), 7.44–7.41 (m, 2H), 7.38–7.34 (m, 1H), 7.31–7.25 (m, 3H);  $^{13}\text{C}\{^1\text{H}\}$  NMR ( $\text{CDCl}_3$ , 100 MHz):  $\delta$  144.2, 143.1, 137.7, 134.2, 130.8, 129.9, 129.7, 129.18, 129.12, 128.4, 128.2, 127.9, 127.6, 127.09, 127.00, 125.6, 121.6, 120.6, 117.5; anal. calcd for  $\text{C}_{25}\text{H}_{18}\text{N}_2$ : C, 86.68; H, 5.24; N, 8.09; found C, 86.90; H, 5.13; N, 7.97%.
