Microwave irradiation: a green approach for the synthesis of functionalized *N*-methyl-1,4-dihydropyridines†

M. Musawwer Khan,^a Saigal,^a Sarfaraz Khan,^a Sumbulunnisan Shareef^a and Subash C. Sahoo^b

An eco-friendly and cost-effective, microwave-assisted green approach has been developed for the synthesis of diverse functionalized *N*-methyl-1,4-dihydropyridines (1,4-DHPs). This pseudo three-component reaction was carried out between two equivalents of (*E*)-*N*-methyl-1-(methylthio)-2-nitroethenamine (NMSM) and one equivalent of aromatic aldehydes under microwave irradiation at 100 °C without catalyst and solvent. Short reaction times, avoidance of toxic solvents or expensive, metallic and corrosive catalysts and no need for column chromatographic purification are among the valuable features of the presented method. Moreover, the "greenness" of the method was evaluated within the ambits of the defined green metrics such as atom economy, carbon efficiency, *E*-factor, reaction mass efficiency, overall efficiency, process mass intensity and solvent intensity and the method exhibited a good to excellent score.

Introduction

The development of novel, green and sustainable synthetic procedures has received substantial attention because of the growing environmental pollution and its overwhelming effect on human life. Therefore, the design of synthetic protocols with efficient atom economy under catalyst- and solvent-free conditions based on the microwave utilizing multicomponent reaction (MCR) strategy has become a central theme in the evolution of green chemistry.¹ MCRs have the ability to generate conveniently only one product from three or more components in a single synthetic operation with multiple bond formation and high atom economy.² Over the past decade, several classes of heterocycles including natural and unnatural compounds have been successfully synthesized through MCRs.³ Owing to the simple experimental processes and one-pot procedure, the application of catalytic methods involving MCR has gained remarkable attention as it allows simple and straightforward access to novel heterocyclic libraries of small molecules.⁴ MCRs are now renowned and considered as an efficient tool for generating complex and diverse molecules of medicinal importance.⁵ They also have some inherent advantages such as

high bond efficiency, convergence and step economy, short synthetic period, reduction in waste products, high selectivity as well as operational simplicity.⁶ On the other hand, the microwave irradiation assisted synthetic protocol has also gained importance, mainly in developing sustainable solvent- and catalyst-free alternatives to laborious reactions. Additionally, these approaches give better results in contrast to traditional synthesis in terms of waste reduction, extreme drop in reaction times, and relatively isolated pure products, thereby avoiding tedious column chromatographic purification. Hence they embody a prevailing green alternative to conventional synthesis.⁷

Among the nitrogen containing heterocyclic compounds, functionalized 1,4-dihydropyridines are considered as invaluable scaffolds because of their abundance in natural products⁸ and exhibit a variety of biological activities such as anti-hypertension,⁹ anticancer,¹⁰ antioxidant,¹¹ antiviral,¹² anti-tumor,¹³ anti-inflammatory,¹⁴ analgesic¹⁵ and potential calcium channel antagonist activities.¹⁶ 1,4-Dihydropyridines (1,4-DHPs), particularly 4-aryl-substituted-1,4-dihydropyridines, also possess various pharmacological activities like vasodilatory, anti-atherosclerotic, bronchodilatory, antiradical, antitumor and anti-diabetic effects.¹⁷ Extensive studies have revealed that these compounds display other therapeutic properties including HIV protease inhibition, radioprotection, neuroprotection, platelet and antiaggregatory activities *etc.*¹⁸ For example, compound **I** was found to be an anticonvulsant while compound **II** exhibits antileishmanial properties.¹⁹

Recently, sugar derived 1,4-dihydropyridine **III** was revealed to show antitumor activity against two types of tumor cell lines,

Fig. 1 Some biologically active highly substituted 1,4-DHPs.

HepG2 and HeLa (Fig. 1).²⁰ Therefore, the preparation of 1,4-dihydropyridines is one of the most attractive areas of research for synthetic and medicinal chemists due to their diverse applications. For the synthesis of 1,4-DHPs, starting from the classical Hantzsch reaction,²¹ a number of protocols have been reported.²²

In recent times, (*E*)-*N*-methyl-1-(methylthio)-2-nitroethenamine (NMSM) has been found to be a very attractive building block for the synthesis of a variety of nitrogen and oxygen containing heterocyclic compounds.²³ To the best of our knowledge, only one protocol has been reported in the literature so far for the synthesis of *N*-methyl-1,4-dihydropyridines by using NMSM and aromatic aldehydes in presence of a 2-aminopyridine catalytic system.²⁴ However, the above method suffered from some limitations, like very long reaction time, used of toxic catalyst, used of solvent, and lower yields for some of the products. Hence, the need to develop a rapid, efficient, and environmentally benign synthetic protocol for the preparation of such 1,4-DHP derivatives is paramount and justified.

Very recently, we have reported a green approach for the synthesis of 4*H*-chromen-5-ones by using NMSM, dimedone and aromatic aldehydes under catalyst- and solvent-free conditions²⁵ and our group also developed green protocols for the synthesis of biologically active heterocycles such as *N*-substituted-1,4-dihydropyridines, coumarin-fused 1,4-dihydropyridines, tetrahydropyridines, functionalized furan-2-one and pyrrol-2-one.²⁶ In continuation of our research interest to develop newer synthetic methodologies under greener conditions, this paper describes an environmentally benign and sustainable method for the synthesis of highly functionalized *N*-methyl-1,4-DHPs under microwave irradiation without catalyst and solvent as depicted in Scheme 1.

Results and discussion

In our initial studies, a trial reaction was performed with benzaldehyde **1a** (1.0 mmol) and NMSM **2a** (2.0 mmol) in the presence of 10 mol% ZnCl₂ under refluxing ethanol. The reaction progress and consumption of starting materials was checked by TLC. After completion of the reaction as monitored by TLC, the highly substituted *N*-methyl-1,4-DHP derivative **3a** was isolated in 62% yield and the product was characterized by physical properties²⁴ and spectroscopic techniques including IR, ¹H and ¹³C NMR (Table 1, entry 1). Next, we focused on an optimization study to obtain the best results in terms of yield and time. To this end, different catalysts including FeCl₃, SnCl₂·2H₂O, *p*-toluenesulfonic acid (*p*-TSA), piperidine and DBU (10 mol%) were screened in the model reaction under refluxing ethanol. Unfortunately, we did not obtain any improvement in results (Table 1, entries 2–6). Next, we attempted the same reaction in the presence of 10 mol% ZnCl₂ under solvent-free conditions at 80 °C and isolated 70% yield of the product (Table 1, entry 7). Similarly, we have also executed the same reaction under microwave irradiation at 80 °C without solvent in the presence of 10 mol% ZnCl₂, and isolated 79% yield of the product within 20 min. Then the same reaction was also attempted in catalyst- and solvent-free conditions under microwave irradiation at 80 °C. Unexpectedly, this gave a better result in comparison with the above experiments (Table 1, entry 9). Next, to optimize the reaction temperature of this transformation, the above model reaction was executed at different temperatures including 90 °C, 100 °C, 105 °C, 110 °C and 120 °C under microwave irradiation excluding catalyst and solvent (Table 1, entries 10–14). From the above observations, the reaction performed without catalyst and solvent under microwave irradiation at 100 °C emerged as the optimal reaction conditions in terms of the yields and time (Table 1, entry 11). The optimization of reaction yields vs. the reaction temperature is depicted in Fig. 2.

After establishing the optimized conditions, we examined the reaction of NMSM with 4-nitrobenzaldehyde and obtained the desired *N*-methyl-1,4-dihydropyridine derivative **3b** in 85% yield within 10 min. Next, we proceeded to investigate the substrate scope for the presented method with various aromatic aldehydes having substituents including NO₂, Cl, Br, F, OMe, Me and Et under the optimal reaction conditions, and the reaction time and yield of the isolated products **3c–3o** are summarized in Table 2.

^a Reaction conditions: NMSM (**1a** 2.0 mmol), benzaldehyde (**2a** 1.0 mmol). ^b Isolated yields. μw = microwave irradiation.

In general, the reaction proceeded smoothly under the optimized conditions to afford the desired products in good to excellent yields. It was observed that several functionalities, including both electron donating and electron withdrawing groups, in the aromatic ring were compatible with the reaction conditions.

Furthermore, the reactions of NMSM with heteroaryl aldehydes including thiophene-2-carbaldehyde, pyridine-3-carbaldehyde and indole-3-carbaldehyde were executed under this protocol and yielded the corresponding products **3p–3r** in 80–86% yield. In addition, 2-naphthaldehyde also gave the desired product **3s** in 88% yield on heating with NMSM under microwave irradiation at 100 °C as shown in Table 2. After achieving excellent results in terms of yields and time, we moved to practical testing and explored our protocol on the gram-scale level under the optimized conditions.

The gram scale preparation of **3a** was carried out, wherein benzaldehyde (5.0 mmol) successfully reacted with NMSM (10.0 mmol) under the optimized conditions to yield the desired product in 88% yield (1.48 g) after 15 min as depicted in Scheme 1. The newly synthesized compounds were confirmed by their melting points, spectroscopic techniques (FTIR, ¹H NMR, ¹³C NMR, HRMS) and elemental analysis, and matched well with the reported data.²⁴ The spectroscopic data are in good agreement with the proposed structure and some characteristic NMR peaks assigned for compound **3n** are shown in Fig. S2 (see ESI†). Finally, the structure as well as the relative stereochemistry of 1,4-dihydropyridine **3n** was confirmed by X-ray crystallographic analysis (CCDC 1841358). From the crystal structure, it was found that the 1,4-dihydropyridine ring adopted a boat conformation in which the flag pole positions 1 and 4 are occupied by the –N–CH₃ and –Ph–CH₃ group respectively. The ORTEP representation of compound **3n** is presented in Fig. 3.

^a NMSM and aromatic aldehydes in a 2 : 1 ratio, microwave irradiation (200 W) at 100 °C. ^b Isolated yields.

A single crystal was mounted on a glass fibre and used for data collection. A metallic light yellow coloured crystal of compound **3n** was grown by slow evaporation of acetonitrile solvent for X-ray analysis. The single crystal X-ray diffraction data were collected from a SuperNova diffractometer, single source at offset/far, with a HyPix3000 detector using graphite-monochromated MoK α radiation ($\lambda = 0.71073$ Å) at 293 K. The crystallized compound has a triclinic crystal system, space group $P\bar{1}$, and unit cell dimensions $a = 7.3596(3)$ Å, $b = 9.2464(6)$ Å, $c = 14.1726(5)$ Å. The unit cell packing of the compound **3n** is shown in Fig. 4.

Finally, a plausible reaction mechanism for the synthesis of *N*-methyl-1,4-dihydropyridine was proposed, as shown in Scheme 2. We consider that the first step involves the Knoevenagel condensation of one molecule of NMSM and aromatic aldehyde to form intermediate **I**. To study the formation of proposed intermediate **I** and to isolate it, we have also conducted a reaction with NMSM (1.0 mmol) and benzaldehyde (1.0 mmol) under the optimised reaction conditions, but unfortunately we unable to isolate the intermediate **I**. In this control case we obtained the proposed product in lower yield. Nonetheless, we proceed on the assumption that the intermediate **I**

Fig. 3 ORTEP diagram of compound **3n** (CCDC 1841358).

Fig. 4 Unit cell packing of compound **3n**.

was formed, which acted as a Michael acceptor and reacted with the Michael donor compound NMSM.^{23b,24}

Another molecule of NMSM reacted with Knoevenagel product **I** and formed Michael adduct **II**, which underwent rotation to give conformer **III**. Then, the key intermediate **III** underwent intra-molecular *N*-cyclization to form species **IV**. Finally the species **IV** afforded the desired product by the elimination of -MeSH . In contrast the elimination of -MeNH_2 and formation of **3a'** (2,6-bismethylthio derivative) were not observed. Comparing the leaving capacity of -MeNH_2 and -MeSH , the latter is more labile and has a greater leaving tendency.

In the context of green chemistry, it was required to validate our synthetic method as environmentally benign, which was performed through the evaluation of green chemistry metrics for this one-pot synthesis of *N*-methyl-1,4-dihydropyridines.^{27–29} Several green metrics, including atom economy (AE), carbon efficiency (CE), reaction mass efficiency (RME), overall efficiency (OE), process mass intensity (PMI), *E*-factor and solvent intensity (SI), have been evaluated for all the synthesized compounds, which empowers us to assess the present synthetic method in terms of waste, carbon efficiency and energy usage. The calculated values of the green metrics of all the synthesized compounds are summarized in Table S2 (see ESI†).

The calculated values, including high atom economy (83–86%), carbon efficiency (93–94%), overall efficiency (85–94%), and small *E*-factor (4–3), solvent intensity (4–3) and PMI (5–4), endorse this presented method as green and sustainable.

Conclusion

In summary, the present study demonstrated the development of a rapid, sustainable, environmentally benign and highly efficient synthetic protocol for the preparation of *N*-methyl-1,4-dihydropyridine derivatives under microwave irradiation

Scheme 2 Plausible reaction mechanism for the synthesis of *N*-methyl-1,4-DHPs.

without catalyst and solvent. This protocol offers noteworthy advantages such as good to excellent yields, short reaction time, avoidance of toxic catalyst and solvent, wide range of applicability, purification by crystallization, easily available starting materials, low cost, clean reaction profiles and good amenability with the principles of green chemistry. In addition, the presented methodology produced smaller amounts of waste, with good to excellent values of green chemistry metrics (AE, CE, RME, OE, PMI, SI and *E*-factor), and our method stands as an exemplary choice in this framework.

Experimental section

General information

Commercially available solvents and chemicals were obtained from suppliers and used to execute this work as received unless otherwise mentioned. All the reactions were performed on a Monowave 300 microwave synthesizer (Anton Paar) by employing a glass vial G10. TLC analysis was performed using silica gel GF-254 from SRL. Stuart digital melting point apparatus (SMP10) was used for the measurement of melting points, which are uncorrected. FTIR spectra were recorded in potassium bromide pellets on a Perkin-Elmer 10.4.00 IR spectrophotometer. ¹H-NMR and ¹³C-NMR spectral analysis were carried out on Bruker (Avance-II 400 MHz, Varian-AS400 NMR) spectrometers using TMS as an internal standard and DMSO-*d*₆ as a solvent. Crystal data were collected with a SuperNova diffractometer, single source at offset/far, with a HyPix3000 detector (CCD) at 293 K using graphite monochromated MoK α radiation ($\lambda = 0.71073$ Å). Elemental analysis was performed on a Perkin-Elmer-2400 CHN/S analyser and Thermo Scientific (FLASH 2000) analyser while high resolution mass spectra were recorded on an ORBITRAP mass analyser (Thermo Scientific, Q Exactive) under electrospray ionisation (ESI) conditions.

General procedure for the preparation of *N*-methyl-1,4-dihydropyridines (3a–s)

A mixture of aromatic aldehydes (1.0 mmol) and (*E*)-*N*-methyl-1-(methylthio)-2-nitroethenamine (NMSM) (2.0 mmol) was taken in a glass vial G10 and irradiated with microwave radiation (200 W) at 100 °C on a Monowave 300 synthesizer for 10–15 min. The reaction progress and consumption of starting materials were checked by TLC. After completion of the reaction as indicated by TLC, the resulting precipitate-containing glass vial was withdrawn from the microwave oven and allowed to cool. Then the precipitate was washed with 1.5 mL of cold ethanol and dried. Recrystallization was performed from hot ethanol to provide the pure products.

4-(4-Bromophenyl)-*N*,1-dimethyl-6-(methylthio)-3,5-dinitro-1,4-dihydropyridin-2-amine (3g). Isolated as light yellow solid; yield: 86%; 358 mg; mp: 218–220 °C; IR (KBr, cm^{−1}): 3239, 3016, 2931, 1631, 1561, 1485, 1396, 1283, 1164, 1039, 726 cm^{−1}; ¹H NMR (400 MHz, DMSO-*d*₆) δ 2.52 (s, 3H), 3.19 (s, 3H), 3.46 (s, 3H), 6.11 (s, 1H), 6.97 (d, *J* = 6.8 Hz, 2H), 7.18 (d, *J* = 8 Hz, 2H), 10.06 (s, 1H), ¹³C NMR (100 MHz, DMSO-*d*₆) δ 16.3, 31.6, 40.6, 42.7, 111.2, 115.5, 115.7, 128.5, 128.6, 142.8, 146.5, 156.0; anal. calcd (%) for C₁₄H₁₅BrN₄O₄S: C, 40.49; H, 3.64; N, 13.49, S, 7.72. Found: C, 40.40; H, 3.62; N, 13.45, S, 7.69.

4-(3-Bromophenyl)-*N*,1-dimethyl-6-(methylthio)-3,5-dinitro-1,4-dihydropyridin-2-amine (3h). Isolated as yellow solid; yield: 88%; 366 mg; mp: 206–208 °C; IR (KBr, cm⁻¹): 3206, 3053, 2932, 2854, 1635, 1560, 1490, 1361, 1279, 1168, 1070, 775 cm⁻¹; ¹H NMR (400 MHz, DMSO-*d*₆) δ 2.59 (s, 3H), 3.10 (s, 3H), 3.46 (s, 3H), 5.95 (s, 1H), 7.13 (d, *J* = 8 Hz, 1H), 7.28–7.32 (m, 2H), 7.48 (d, *J* = 8 Hz, 1H), 10.10 (s, 1H), ¹³C NMR (100 MHz, DMSO-*d*₆) δ 16.7, 32.4, 40.9, 43.4, 112.8, 122.4, 126.1, 130.2, 131.0, 131.7, 136.7, 142.9, 156.4, 156.6; anal. calcd (%) for C₁₄H₁₅BrN₄O₄S: C, 40.49; H, 3.64; N, 13.49; S, 7.72. Found: C, 40.38; H, 3.66; N, 13.52; S, 7.75; anal. calcd for [C₁₄H₁₅BrN₄O₄S + H⁺]: calcd: 415.0070, found: 415.0070.

4-(4-Fluorophenyl)-*N*,1-dimethyl-6-(methylthio)-3,5-dinitro-1,4-dihydropyridin-2-amine (3i). Isolated as light yellow solid; yield: 90%; 319 mg; mp: 230–232 °C; IR (KBr, cm⁻¹): 3216, 3020, 2958, 1620, 1562, 1480, 1395, 1277, 1180, 1074, 778 cm⁻¹; ¹H NMR (400 MHz, DMSO-*d*₆) δ 2.60 (s, 3H), 3.11 (d, *J* = 4.8 Hz, 3H), 3.48 (s, 3H), 6.08 (s, 1H), 7.45 (d, *J* = 8.8 Hz, 2H), 8.17 (d, *J* = 8.8 Hz, 2H), 10.15 (s, 1H), ¹³C NMR (100 MHz, DMSO-*d*₆) δ 16.8, 32.5, 41.1, 43.6, 112.5, 124.6, 128.8, 136.1, 147.3, 147.5, 156.4, 157.4; anal. calcd (%) for C₁₄H₁₅FN₄O₄S: C, 47.45; H, 4.27; N, 15.81, S, 9.05. Found: C, 47.35; H, 4.25; N, 15.78, S, 9.02.

4-(4-Methoxyphenyl)-*N*,1-dimethyl-6-(methylthio)-3,5-dinitro-1,4-dihydropyridin-2-amine (3j). Isolated as yellow solid; yield: 92%; 338 mg; mp: 200–202 °C; IR (KBr, cm⁻¹): 3208, 3012, 2924, 2832, 1620, 1564, 1482, 1377, 1267, 1160, 1065, 710 cm⁻¹; ¹H NMR (400 MHz, DMSO-*d*₆) δ 2.57 (s, 3H), 3.10 (s, 3H), 3.45 (s, 3H), 3.71 (s, 3H), 5.91 (s, 1H), 6.86 (d, *J* = 8.8 Hz, 2H), 7.06 (d, *J* = 8.8 Hz, 2H), 10.11 (s, 1H), ¹³C NMR (100 MHz, DMSO-*d*₆) δ 16.5, 32.3, 40.6, 43.3, 55.5, 113.5, 114.7, 128.4, 132.2, 138.1, 155.0, 156.5, 159.1; anal. calcd (%) for C₁₅H₁₈N₄O₅S: C, 49.17; H, 4.95; N, 15.29; S, 8.75. Found: C, 49.05; H, 4.93; N, 15.25; S, 8.72.

4-(3-Methoxyphenyl)-*N*,1-dimethyl-6-(methylthio)-3,5-dinitro-1,4-dihydropyridin-2-amine (3k). Isolated as yellow solid; yield: 88%; 323 mg; mp: 236–238 °C; IR (KBr, cm⁻¹): 3237, 3015, 2940, 2837, 1618, 1562, 1489, 1358, 1285, 1174, 1072, 739 cm⁻¹; ¹H NMR (400 MHz, DMSO-*d*₆) δ 2.58 (s, 3H), 3.10 (s, 3H), 3.45 (s, 3H), 3.72 (s, 3H), 5.97 (s, 1H), 6.64 (s, 1H), 6.70 (d, *J* = 8 Hz, 1H), 6.84 (dd, *J* = 8 Hz, 3.2 Hz, 1H), 7.24 (t, *J* = 8 Hz, 1H), 10.10 (s, 1H), ¹³C NMR (100 MHz, DMSO-*d*₆) δ 16.6, 32.4, 40.6, 43.3, 55.5, 113.0, 113.2, 119.2, 130.6, 137.6, 141.9, 155.4, 156.5, 159.9; anal. calcd (%) for C₁₅H₁₈N₄O₅S: C, 49.17; H, 4.95; N, 15.29; S, 8.75. Found: C, 49.08; H, 4.97; N, 15.32; S, 8.77; anal. calcd for [C₁₅H₁₈N₄O₅S + H⁺]: calcd: 367.1070, found: 365.1278.

4-(3,4-Dimethoxyphenyl)-*N*,1-dimethyl-6-(methylthio)-3,5-dinitro-1,4-dihydropyridin-2-amine (3l). Isolated as yellow solid; yield: 90%; 357 mg; mp: 242–244 °C; IR (KBr, cm⁻¹): 3238, 3002, 2842, 2930, 1618, 1563, 1470, 1361, 1234, 1162, 1074, 775 cm⁻¹; ¹H NMR (400 MHz, DMSO-*d*₆) δ 2.57 (s, 3H), 3.09 (d, *J* = 4.4 Hz, 3H), 3.47 (s, 3H), 3.69 (s, 3H), 3.70 (s, 3H), 5.91 (s, 1H), 6.62–6.66 (m, 2H), 6.87 (d, *J* = 6.6 Hz, 1H), 10.13 (s, 1H), ¹³C NMR (100 MHz, DMSO-*d*₆) δ 16.1, 31.9, 40.1, 42.9, 55.3, 55.5, 110.1, 111.9, 118.9, 132.1, 137.5, 148.2, 148.9, 154.7, 156.0; anal. calcd (%) for C₁₆H₂₀N₄O₆S: C, 48.48; H, 5.09; N, 14.13, S, 8.09; found: C, 48.38; H, 5.07; N, 14.09, S, 8.06; anal. calcd. for [C₁₆H₂₀N₄O₆S + H⁺]: calcd: 397.1176, found: 397.1176.

***N*,1-Dimethyl-6-(methylthio)-3,5-dinitro-4(3,4,5-trimethoxyphenyl)-1,4-dihydropyridin-2-amine (3m).** Isolated as yellow solid; yield: 92%; 393 mg; mp: 260–262 °C; IR (KBr, cm⁻¹): 3237, 2995, 2938, 2839, 1636, 1562, 1492, 1367, 1277, 1162, 1068, 719 cm⁻¹; ¹H NMR (400 MHz, DMSO-*d*₆) δ 2.58 (s, 3H), 3.11 (s, 3H), 3.52 (s, 3H), 3.62 (s, 3H), 3.74 (s, 6H), 5.94 (s, 1H), 6.37 (s, 2H), 10.12 (s, 1H), ¹³C NMR (100 MHz, DMSO-*d*₆) δ 16.6, 32.3, 41.2, 43.4, 56.3, 60.40, 104.3, 113.2, 128.2, 135.9, 137.4, 137.6, 153.5, 155.4, 156.5; anal. calcd (%) for C₁₇H₂₂N₄O₇S: C, 47.88; H, 5.20; N, 13.14; S, 7.52; found: C, 47.76; H, 5.17; N, 13.10; S, 7.49.

***N*,1-Dimethyl-6-(methylthio)-3,5-dinitro-4(*p*-tolyl)-1,4-dihydropyridin-2-amine (3n).** Isolated as light yellow solid; yield: 94%; 330 mg; mp: 212–214 °C; IR (KBr, cm⁻¹): 3163, 3013, 2954, 2854, 1628, 1564, 1488, 1390, 1270, 1186, 1077, 787 cm⁻¹; ¹H NMR (400 MHz, DMSO-*d*₆) δ 2.25 (s, 3H), 2.57 (s, 3H), 3.09 (d, *J* = 5.2 Hz, 3H), 3.44 (s, 3H), 5.95 (s, 1H), 7.02 (d, *J* = 8 Hz, 2H), 7.12 (d, *J* = 8 Hz, 2H), 10.11 (s, 1H), ¹³C NMR (100 MHz, DMSO-*d*₆) δ 16.5, 21.0, 32.3, 40.8, 43.3, 113.3, 127.0, 129.9, 137.2, 137.4, 137.9, 155.2, 156.5 anal. calcd (%) for C₁₅H₁₈N₄O₄S: C, 51.42; H, 5.18; N, 15.99, S, 9.15. Found: C, 51.30; H, 5.16; N, 15.95, S, 9.12.

4-(4-Ethylphenyl)-*N*,1-dimethyl-6-(methylthio)-3,5-dinitro-1,4-dihydropyridin-2-amine (3o). Isolated as light yellow solid; yield: 92%; 336 mg; mp: 236–238 °C; IR (KBr, cm⁻¹): 3230, 3010, 2928, 2856, 1623, 1564, 1480, 1395, 1278, 1180, 1076, 787 cm⁻¹; ¹H NMR (400 MHz, DMSO-*d*₆) δ 1.13 (t, *J* = 8 Hz, 3H), 2.53 (q, *J* = 7.6 Hz, 2H), 2.57 (s, 3H), 3.09 (d, *J* = 5.2 Hz, 3H), 3.45 (s, 3H), 5.95 (s, 1H), 7.05 (d, *J* = 8 Hz, 2H), 7.15 (d, *J* = 8 Hz, 2H), 10.11 (s, 1H), ¹³C NMR (100 MHz, DMSO-*d*₆) δ 15.9, 16.5, 28.2, 32.3, 40.7, 43.3, 112.4, 127.2, 128.7, 137.6, 137.9, 143.5, 155.2, 156.5; anal. calcd (%) for C₁₆H₂₀N₄O₄S: C, 52.73; H, 5.53; N, 15.37, S, 8.80. Found: C, 52.60; H, 5.51; N, 15.33, S, 8.77.

***N*,1-Dimethyl-6-(methylthio)-3,5-dinitro-4(thiophen-2-yl)-1,4-dihydropyridin-2-amine (3p).** Isolated as light yellow solid; yield: 86%; 295 mg; mp: 208–210 °C; IR (KBr, cm⁻¹): 3103, 3011, 2928, 1633, 1564, 1489, 1395, 1276, 1187, 1070, 778 cm⁻¹; ¹H NMR (400 MHz, DMSO-*d*₆) δ 2.52 (s, 3H), 3.19 (s, 3H), 3.45 (s, 3H), 6.39 (s, 1H), 6.92 (d, *J* = 16 Hz, 2H), 7.42 (s, 1H), 9.98 (s, 1H), ¹³C NMR (100 MHz, DMSO-*d*₆) δ 16.3, 31.6, 36.4, 42.6, 124.3, 124.9, 127.2, 137.7, 142.7, 152.8, 155.8; anal. calcd (%) for C₁₂H₁₄N₄O₄S₂: C, 42.09; H, 4.12; N, 16.36, S, 18.73. Found: C, 42.19; H, 4.14; N, 16.33, S, 18.70.

Conflicts of interest

There are no conflicts to declare.

Acknowledgements

Saigal and SK acknowledge the CSIR and UGC, New Delhi respectively, for their Fellowship. S. C. Sahoo acknowledge to DST-FIST for single crystal XRD facility. The authors are also thankful to IIT Patna, NCL Pune for providing NMR and HRMS facility. The authors are also grateful to the Chairman, Department of Chemistry, AMU, Aligarh, for providing necessary research facilities to complete this work. We are also thankful to the referees for their valuable suggestions.
