#### Introduction

#### Organostannanes are organometallic reagents widely used for organic synthesis.1 They are easy to handle because of their inertness towards oxygen and moisture, while the organostannanes are reactive with various electrophiles in the presence of appropriate activators. A typical example is the palladium-catalysed cross-coupling reaction (Stille coupling).<sup>2</sup> The organostannanes have been most commonly prepared by the reaction of highly reactive organometals (RLi, RMgX) with tin electrophiles, and considerable attention has been paid to the development of their new synthetic methods. Palladium- or nickel-catalysed stannylation of organic electrophiles with distannanes is one of the examples.<sup>3</sup> Here we report our findings that migratory arylstannylation of unfunctionalised alkynes is catalysed by Rh complexes in the presence of a catalytic amount of ZnCl<sub>2</sub> to give high yields of ortho-alkenylarylstannanes with high selectivity. The reaction is proposed to proceed through 1,4-migration of Rh from alkenyl carbon to aryl carbon<sup>4-6</sup> (Scheme 1a). Carbostannylation of alkynes with allyl- and alkynylstannanes has been reported to be catalysed by transition metals such as Pd and Ni,7,8 but the addition of arylstannanes has not been reported, to the best of our knowledge (Scheme 1b). This type of arylmetalation reaction that is accompanied by the 1,4-migration of the metal has been reported by Yoshikai for arylzincation catalysed by a cobalt

### Addition of arylstannanes to alkynes giving orthoalkenylarylstannanes catalysed cooperatively by a rhodium complex and zinc chloride<sup>†</sup>

Jialin Ming, Qi Shi and Tamio Hayashi 匝 \*

The reaction of arylstannanes  $ArSnR_3$  with unfunctionalised alkynes was found to proceed in the presence of a rhodium catalyst and a catalytic amount of zinc chloride to give *ortho*-alkenylarylstannanes with high selectivity in high yields. The catalytic cycle is very unique, consisting of three transmetalation steps, from Sn to Rh, Rh to Zn, and Zn to Sn, in addition to arylrhodation of alkyne followed by 1,4-migration of Rh from 2arylalkenyl carbon to *ortho*-alkenylaryl carbon.

#### Results and discussion

The results obtained for the reaction of 4-octyne (2a) with PhSnBu<sub>3</sub> (1a, 2.0 equiv. to 2a) under various conditions are summarised in Table 1. The migratory arylstannylation was found to proceed in the presence of  $\text{ZnCl}_2$  (1.0 equiv. to 2a) and a rhodium catalyst generated from  $[\text{RhCl}(\text{coe})_2]_2$  (5.0 mol% of Rh) and binap<sup>10</sup> (5.5 mol%) in dioxane at 130 °C for 16 h to give 85% yield of 4-(2-stannylphenyl)-4-octene (3aa) with perfect *E* geometry<sup>11</sup> (entry 1). The direct arylstannylation product 4aa was not formed in a detectable amount under these reaction

<sup>a</sup> Reaction conditions: 4-octyne (2a) (0.20 mmol), PhSnBu<sub>3</sub> (1a) (0.40 mmol) and  $\text{ZnCl}_2$  (0.20 mmol) in dioxane (1.0 mL) at 130 °C (bath temp.) for 16 h. <sup>b</sup> Rh catalyst (5 mol% of Rh) was generated *in situ* from  $[RhCl(coe)_2]_2$  (10 µmol of Rh) and bisphosphine (11 µmol). <sup>c</sup> Isolated yield. <sup>d</sup> At 100 °C. <sup>e</sup> RhCl(PPh<sub>3</sub>)<sub>3</sub> (10 µmol). <sup>f</sup> [RhCl(cod)]<sub>2</sub> (10  $\mu$  mol of Rh), <sup>g</sup> [IrCl(coe)<sub>2</sub>]<sub>2</sub> (10  $\mu$ mol of Ir) + binap (11  $\mu$ mol).  $CoCl_2(xantphos)$  (10 µmol).

conditions. The yield of 3aa was dependent on the amount of ZnCl<sub>2</sub> to some extent. With 2.0 equiv. of ZnCl<sub>2</sub>, the yield was slightly increased (89%) (entry 2). The yields were lower with less amount of ZnCl<sub>2</sub>, being 73%, 71% and 27%, with 0.50, 0.25 and 0.10 equiv. of ZnCl<sub>2</sub>, respectively (entries 3-5). It is noted that ZnCl<sub>2</sub> is working as a catalyst though a substoichiometric amount is necessary for a high yield of 3aa. The presence of ZnCl<sub>2</sub> is essential for the present arylstannylation, 3aa being not formed at all in its absence (entry 6). At lower reaction temperature (100 °C), the yield of 3aa was lower by 10% (entry 7). Other zinc halides,  $ZnBr_2$  and  $ZnI_2$  were less catalytically active than ZnCl<sub>2</sub> (entries 8 and 9). It is difficult to find a substitute of ZnCl<sub>2</sub> from other metal salts. CuCl<sup>12</sup> gave a trace amount of 3aa (entry 10). The binap ligand on Rh can be replaced by segphos or biphep, both of which are analogous to

binap in that their backbones connecting two phosphino groups are biaryls. The yields with segphos<sup>13</sup> and biphep were slightly lower (73% and 71%, respectively) than that with binap for the reaction of PhSnBu<sub>3</sub> (1a) (entries 11 and 12), but for the reactions of some other arylstannanes, the yields of the arylstannylation products are higher with segphos ligand (see Table 2). The catalytic activity of other phosphine-Rh complexes were much lower. While dppf ligand gave a low yield (16%) of 3aa (entry 13), the reaction did not take place with dppe, dppp, xantphos or PPh<sub>3</sub> (entries 14–17). Rh complex with cyclooctadiene (cod) ligand or Ir/binap complex did not catalyse the reaction either (entries 18 and 19). The cobalt complex, CoCl<sub>2</sub>(xantphos), which has been reported to be an effective catalyst for the migratory arylzincation,9 is not a catalyst of choice for the present arylstannylation, yielding only 7% of 3aa (entry 20).

<sup>a</sup> Reaction conditions: 4-octyne (2a) (0.20 mmol), ArSnR<sub>3</sub> 1 (0.40 mmol), ZnCl<sub>2</sub> (0.20 mmol) and Rh catalyst (5 mol% of Rh) in dioxane (1.0 mL) at 130 °C (bath temp.) for 16 h. <sup>b</sup> Rh catalyst (5 mol% of Rh) was generated in situ from [RhCl(coe)2]2 (10 µmol of Rh) and binap or segphos (11 µmol). <sup>c</sup> Isolated yield. <sup>d</sup> In THF at 90 °C. <sup>e</sup> Regioselective 1,4-shift giving the products 3 shown below.

The reaction conditions optimised for the phenylstannylation with PhSnBu<sub>3</sub> (1a), that is, with Rh/binap (5 mol%) and ZnCl<sub>2</sub> (1.0 equiv.) at 130 °C (entry 1 in Table 1), were successfully applied to the reaction of several other aryltin reagents  $ArSnR_3$  with 4-octyne (2a) (Table 2). The phenyltin reagents PhSnR<sub>3</sub>, where R is methyl (1b), propyl (1c) and octyl (1d), all gave the corresponding phenylstannylation products 3ba-3da in high yields (entries 2-4). The yields are generally high for para-substituted aryltin reagents, those substituted with Me, Ph, Me<sub>3</sub>Si and CF<sub>3</sub>O groups giving the corresponding products in 83-91% yields (entries 5-8). The lower yield (65%) for MeO-substituted one 1i is mainly due to the instability of the product 3ia under the reaction conditions (entry 9). For the reaction of aryltin reagents substituted with electron-withdrawing groups at *para*-position, Cl (1k), Br (1l), CN (1m) and COOMe (1n), the Rh/binap catalyst was not very effective resulting in lower vields of the corresponding arylstannylation products. The use of Rh/segphos as a catalyst instead of Rh/binap improved the reaction for these aryltin reagents (entries 11-18). A typical example is the reaction of 4-BrC<sub>6</sub>H<sub>4</sub>SnBu<sub>3</sub>, where the yields of the product 3la are 47% and 78% with binap and segphos ligands, respectively (entries 13 and 14). In the arylstannylation with meta-substituted aryltin reagents, perfect regioselectivity at the 1,4-migration was observed. Thus, the reaction of those substituted with Me (1p), Me<sub>3</sub>Si (1q) and CF<sub>3</sub> (1r) gave the corresponding 2,4-disubstituted aryltins 3pa-3ra, which are the less hindered isomers, exclusively (entries 20-22). The regioselectivity was also high for the reaction of 2-naphthyltin 1s, where the 1,4-migration took place to the less hindered 3-position selectively (entry 23). Unfortunately, the migratory arylstannylation did not take place for orthosubstituted tin reagent 1t under the present conditions (entry 24).

The results obtained for the reaction of PhSnBu<sub>3</sub> (1a) with several unfunctionalised alkynes substituted with alkyl and aryl groups are summarised in Table 3. The migratory arylstannylation proceeded well for longer-chained dialkylacetylenes, 5-decyne (2b) and 8-hexadecyne (2c), to give high yields of the corresponding products, 3ab and 3ac, respectively. In the reaction of unsymmetrically substituted dialkylacetylene 2d, the regioselectivity at the addition to alkyne was low, resulting in the formation of a mixture of 3ad and its regioisomer in a ratio of 1.2/1.0. Diarylacetylenes also underwent the migratory arylstannylation, although the yields are generally lower than those for dialkylacetylenes.14 The reaction of alkyl(aryl)alkynes 2h-2l, proceeded with high regioselectivity for the bond formation between phenyl group of phenyltin 1a and alkyl-substituted alkyne carbon. This selectivity is as expected from the reported regiochemistry at carbometalation of alkyl(aryl)alkynes.15

The reaction pathway of the present migratory arylstannylation of alkynes, which is catalysed cooperatively by Rh complex and ZnCl<sub>2</sub>, is proposed as shown in Scheme 2. Thus, the transmetalation of phenyl group from Sn to Rh takes place at the reaction of PhSnR<sub>3</sub> **1** with a Cl–Rh species **A** to generate Ph–Rh intermediate **B** and ClSnR<sub>3</sub>,<sup>16</sup> the latter being to be involved at the final step leading to the stannylation product **3**. The *syn*-addition of Ph–Rh **B** to alkyne **2** generates 2-arylalkenyl– Rh **C** and **1**,4-migration of Rh from alkenyl to phenyl<sup>4,5</sup> gives

Table 3 Rhodium-catalysed arylstannylation of alkynes 2 with PhSnBu<sub>3</sub>  $(1a)^{\alpha}$ 

<sup>*a*</sup> Reaction conditions: alkyne 2 (0.20 mmol), PhSnBu<sub>3</sub> **1a** (0.40 mmol), ZnCl<sub>2</sub> (0.20 mmol) and Rh catalyst (5 mol% of Rh), generated *in situ* from [RhCl(coe)<sub>2</sub>]<sub>2</sub> (10 µmol of Rh) and binap (11 µmol), in dioxane (1.0 mL) at 130 °C (bath temp.) for 16 h. The structures of main regioisomers are shown for the products from unsymmetrically substituted alkynes.

*ortho*-alkenylphenyl–Rh intermediate **D**, which has been reported to be thermodynamically more stable than C.<sup>5e</sup> Transmetalation between the *ortho*-alkenylpheny–Rh **D** and ZnCl<sub>2</sub> takes place to give arylzinc chloride **E** and the Cl–Rh species **A**. Finally, the reaction of arylzinc chloride **E** with ClSnR<sub>3</sub>,<sup>17</sup> which was formed at the transmetalation between PhSnR<sub>3</sub> **1** and Cl–Rh **A**, leads to *ortho*-alkenylphenystannane **3**, with regenerating ZnCl<sub>2</sub>. Direct transmetalation between the Ar–Rh intermediate **D** and PhSnR<sub>3</sub> **1** giving Ph–Rh **B** and the product **3** is less likely because a catalytic amount of ZnCl<sub>2</sub> is essential for the present arylstannylation to take place (see entries 1–6 in Table 1).

The reactions shown in Scheme 3 gave us further information on the catalytic cycle. Stoichiometric reactions of Ph–Rh complex, RhPh(PPh<sub>3</sub>) (binap) (5),<sup>18</sup> with ClSnBu<sub>3</sub> (2.0 equiv.) in

Scheme 2 A catalytic cycle proposed for migratory arylstannylation of alkynes catalysed by Rh complex and ZnCl<sub>2</sub>.

Scheme 3 Reactions to support the catalytic cycle.

the presence of ZnCl<sub>2</sub> (1.2 equiv.) in dioxane at 130 °C gave 93% yield of PhSnBu<sub>3</sub> (1a), while the yield of 1a is very low (12%) in the absence of ZnCl<sub>2</sub> under otherwise the same conditions (Scheme 3a). These reactions are related to the last transmetalation step producing 3 from Ar-Rh intermediate D in the catalytic cycle. The results show that the direct transmetalation between intermediate D and ClSnR<sub>3</sub> is slow and that ZnCl<sub>2</sub> greatly accelerates the transmetalation. The fast transmetalation in the presence of ZnCl<sub>2</sub> is probably because of a lower energy caused by the double transmetalations from Rh to Zn and from Zn to Sn by way of arylzinc species E. Rhodiumcatalysed 1,4-migration of Sn from alkenylstannane 4ae to arylstannane 3ae was observed in the presence of ZnCl<sub>2</sub>, albeit in a low yield (16%).19 The 1,4-migration of Sn did not take place in the absence of ZnCl<sub>2</sub> (Scheme 3b). The catalytic cycle involving the 1,4-Rh shift from intermediates C to D is supported by these results. The deuterium-labeling study using  $C_6D_5SnBu_3$  (1a-d<sub>5</sub>) (Scheme 3c), where the deuterium is incorporated at olefinic carbon in 3aa-d<sub>5</sub>, further supports this catalytic cycle involving the 1,4-Rh shift. The present  $Rh/ZnCl_2$ cocatalyst system is also applicable to the addition of PhZnCl

Scheme 4 Transformation of *ortho*-alkenylarylstannane **3aa**. (a)  $(CF_3CO)_2O$ ,  $D_2O$ . (b)  $I_2$ ,  $CH_2CI_2$ . (c) Selectfluor, AgOTf, acetone. (d)  $4-IC_6H_4COOMe$ ,  $PdCI_2(PPh_3)_2$  (10 mol%), CuI, DMF. (e) 2-Cyclohexenone, [RhCl(cod)]<sub>2</sub> (5 mol% Rh), KOH, dioxane/H<sub>2</sub>O.

(6a) to 4-octyne (2a) generating *ortho*-alkenylphenylzinc species  $7,^{20}$  the reaction of which with ClSnBu<sub>3</sub> gave 78% yield of the tin compound 3aa (Scheme 3d).

The synthetic utility of arylstannanes has been well established.<sup>1</sup> According to the reported procedures,<sup>21-23</sup> tributylstannyl group in **3aa** was converted into deuterio (**8**), iodo (**9**) and fluoro (**10**) successfully (Scheme 4). The palladiumcatalysed cross-coupling with an aryl iodide<sup>2</sup> and the rhodium-catalysed conjugate addition to 2-cyclohexenone<sup>16</sup> gave high yields of the corresponding products, **11** and **12**, respectively, as expected.

#### Conclusions

To summarise, migratory arylstannylation was found to take place in the reaction of arylstannanes ArSnR<sub>3</sub> with unfunctionalised alkynes in the presence of a bisphosphine–rhodium catalyst and a catalytic amount of zinc chloride to produce *ortho*-alkenylarylstannanes in high yields. A catalytic cycle involving three transmetalation steps is proposed. That is, transmetalation of aryl groups from Sn to Rh, Rh to Zn, and Zn to Sn.

- 7 For reviews on carbostannylation of C-C multiple bonds: (a)
  H. Yoshida, Synthesis, 2016, 48, 2540; (b) E. Shirakawa, Carbostannylation of Carbon-Carbon Unsaturated Bonds, in *Tin Chemistry: Fundamentals, Frontiers, and Applications*, ed. M. Gielen, A. G. Davies, K. H. Pannell and E. R. Tiekink, John Wiley & Sons, Chichester, 2008, pp. 640–652; (c) E. Shirakawa and T. Hiyama, *Bull. Chem. Soc. Jpn.*, 2002, 75, 1435; (d) E. Shirakawa and T. Hiyama, *J. Organomet. Chem.*, 2002, 653, 114.
- 8 Examples of carbostannylation of alkynes: (a) M. Shimizu, G. Jiang, M. Murai, Y. Takeda, Y. Nakao, T. Hiyama and

E. Shirakawa, *Chem. Lett.*, 2005, **34**, 1700; (*b*) E. Shirakawa, Y. Yamamoto, Y. Nakao, S. Oda, T. Tsuchimoto and

- T. Hiyama, *Angew. Chem., Int. Ed.*, 2004, 43, 3448; (c)
  E. Shirakawa, H. Yoshida, Y. Nakao and T. Hiyama, *J. Am. Chem. Soc.*, 1999, 121, 4290.
- 9 (a) B.-H. Tan, J. Dong and N. Yoshikai, Angew. Chem., Int. Ed., 2012, 51, 9610; see also: ; (b) B.-H. Tan and N. Yoshikai, Org. Lett., 2014, 16, 3392; (c) J. Wu and N. Yoshikai, Angew. Chem., Int. Ed., 2016, 55, 336; (d) J. Yan and N. Yoshikai, Org. Chem. Front., 2017, 4, 1972.
- H. Takaya, K. Mashima, K. Koyano, M. Yagi, H. Kumobayashi, T. Taketomi, S. Akutagawa and R. Noyori, *J. Org. Chem.*, 1986, **51**, 629.
- 11 The *E* geometry was confirmed by nOe studies of **3aa** and **3na** and X-ray crystal structure analysis of **3ag**. See ESI<sup>†</sup>
- 12 CuBr has been used as a cocatalyst in Fe-catalysed arylmagnesiation of alkynes: E. Shirakawa, T. Yamagami, T. Kimura, S. Yamaguchi and T. Hayashi, *J. Am. Chem. Soc.*, 2005, **127**, 17164.
- 13 T. Saito, T. Yokozawa, T. Ishizaki, T. Moroi, N. Sayo, T. Miura and H. Kumobayashi, *Adv. Synth. Catal.*, 2001, **343**, 264.
- 14 The lower yields are due mainly to the formation of higher molecular weight compounds.
- 15 For a pertinent review on catalytic carbometallation of alkynes: K. Murakami and H. Yorimitsu, *Beilstein J. Org. Chem.*, 2013, **9**, 278.
- 16 The transmetalation from Sn to Rh has been reported for the conjugate addition of aryl- and alkenylstannanes to α,β-unsaturated carbonyl compounds: (a) S. Oi, M. Moro, S. Ono and Y. Inoue, *Chem. Lett.*, 1998, 83; (b) S. Venkatraman, Y. Meng and C.-J. Li, *Tetrahedron Lett.*, 2001, 42, 4459; (c) S. Oi, M. Moro, H. Ito, Y. Honma, S. Miyano and Y. Inoue, *Tetrahedron*, 2002, 58, 91; (d) S. J. Mahoney, A. M. Dumas and E. Fillion, *Org. Lett.*, 2009, 11, 5346.
- 17 The reaction of ClSnR<sub>3</sub> with ArZnX giving ArSnR<sub>3</sub> has been reported: as an early example, X. Zhu, B. E. Blough and F. I. Carroll, *Tetrahedron Lett.*, 2000, 41, 9219.
- 18 T. Hayashi, M. Takahashi, Y. Takaya and M. Ogasawara, J. Am. Chem. Soc., 2002, 124, 5052, see also, G. E. Rudebusch, L. N. Zakharov and S.-Y. Liu, Angew. Chem., Int. Ed., 2013, 52, 9316.
- 19 The low yield is mainly because of low conversion of the alkenylstannane **4ae**.
- 20 The reaction of arylzinc reagents with unfunctionalized alkynes cocatalysed by a Rh complex and  $ZnCl_2$  will be reported in detail in a separate paper.
- 21 D. E. Seitz, R. A. Milius and H. El-Wakil, *Synth. Commun.*, 1981, **11**, 281.
