The authors regret that the incorrect images were displayed for Cu 1/64, CS 1/128 and Cu 0.3 in Fig. 4 of the original version of this manuscript. The correct version of Fig. 4 is shown below. The caption remains unchanged.

Fig. 4 Tubule formation by co-HUVECs in direct contact co-cultures was stimulated by CS and Cu-CS extracts diluted with control medium at 1/32, 1/64 and 1/128, which is indicated by the vWF stained co-HUVECs and statistical study at the end of the cultures (7 days) (a). Immunofluorescence staining of vWF is in green and nuclei in blue. Nuclei were stained in blue with DAPI. Bar = 200 μ m. (b) The quantification and statistical analysis of tubule formation was obtained by counting and comparing the number of tubes in the images. * and ** represent $P < 0.05$ and $P < 0.01$, respectively, when compared with control. # indicates that the co-HUVECs cultured with Cu-CS extracts formed more tubes than those cultured with CS extracts at the same dilution ratios. @ indicates that the co-HUVECs cultured with Cu-CS extracts at the dilution ratio of 1/32 formed more tubes than those cultured with CS extracts at the dilution ratio of 1/128 although these two extracts contain the same concentrations of Si ions.

The Royal Society of Chemistry apologises for these errors and any consequent inconvenience to authors and readers.
