Correction for 'Micro-spectroscopy of HKUST-1 metal–organic framework crystals loaded with tetracyanoquinodimethane: effects of water on host–guest chemistry and electrical conductivity' by Miguel Rivera-Torrente *et al.*, *Phys. Chem. Chem. Phys.*, 2019, **21**, 25678–25689.

Following the publication of our article it came to our attention that a detail of the experimental procedure was overlooked and should be corrected to support the calculations.

In the original article, in the Experimental section in the left column on page 25680, the text reads:

“The objective has a Numerical Aperture (NA) of 0.4, resulting in an $815.5 \times 815.5 \mu\text{m}^2$ diameter spot size. All measurements were performed with a total 0.44 mW power output (power density: $1.27 \times 10^{-5} \text{ W cm}^{-2}$) in the $1500\text{--}2300 \text{ cm}^{-1}$ range.”

However, the corrected text in the Experimental section should read as follows:

“The objective has a Numerical Aperture (NA) of 0.4. The calculated theoretical laser spot size is $1.33 \mu\text{m}$ diameter. All measurements were performed with a total 0.44 mW power output (max. power density: $1.27 \times 10^5 \text{ W cm}^{-2}$) in the $1500\text{--}2300 \text{ cm}^{-1}$ range.”

The Royal Society of Chemistry apologises for these errors and any consequent inconvenience to authors and readers.
