## Further correction: Understanding cation effects in electrochemical CO<sub>2</sub> reduction

Stefan Ringe,<sup>\*ab</sup> Ezra L. Clark,<sup>cd</sup> Joaquin Resasco,<sup>e</sup> Amber Walton,<sup>c</sup> Brian Seger,<sup>d</sup> Alexis T. Bell<sup>c</sup> and Karen Chan<sup>\*f</sup>

Further correction for 'Understanding cation effects in electrochemical CO<sub>2</sub> reduction' by Stefan Ringe *et al.*, *Energy Environ. Sci.*, 2019, 12, 3001–3014.

In Fig. 6 of the original correction to this article, the captions (a) and (b) were switched. The Figure should appear with the following text:

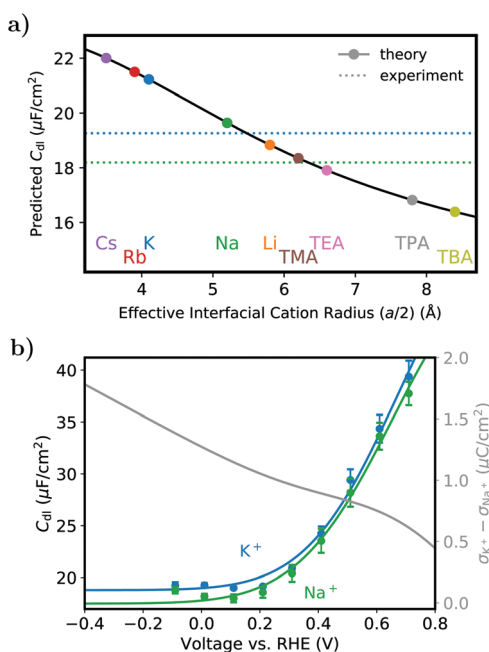

Fig. 6 Dependence of the double layer capacitance on the electrolyte-containing cation. (a) Predicted double layer capacitance from the 1D-continuum model. Solid black line: MPB model predicted double layer capacitance of the Au(111) facet as a function of effective interfacial cation radius at 0 V vs. RHE. Values at the here determined interfacial radii are depicted by filled circles, the dashed lines represent experimental results for K<sup>+</sup> and Na<sup>+</sup> that are shown explicitly in b. (b) Potential-dependence of the double layer capacitance obtained from fitting a RC circuit to the impedance data of a Au(111) single crystal electrode using a 0.05 M KHCO<sub>3</sub> or NaHCO<sub>3</sub> electrolyte. Filled circles denote the data points (left y-axis), the solid gray line (right y-axis) the difference in surface charge density between both experiments under the assumption of the same PZC of 0.97 V vs. RHE.<sup>1</sup>
