Chem.*, 2020, 11, 72Synthesis and evaluation of novel 2,4-disubstituted arylthiazoles against *T. brucei*†Markos-Orestis Georgiadis,<sup>a</sup> Violeta Kourbeli,<sup>a</sup> Ioannis P. Papanastasiou,<sup>a\*</sup> Andrew Tsotinis,<sup>a</sup> Martin C. Taylor<sup>b</sup> and John M. Kelly<sup>b</sup>

The design, synthesis and pharmacological evaluation of the 4-substituted-2-[3-(adamant-1-yl)-4-fluorophenyl]thiazoles **1a–j**, the 4-substituted-2-[4-(adamant-1-yl)phenyl]thiazoles **2a–h**, the 2-substituted-4-[4-(adamant-1-yl)phenyl]thiazoles **3a–e**, the *N*-substituted 2-phenylthiazol-4-ethylamides **4a, b** and the *N*-substituted 4-phenylthiazol-2-ethylamides **4c, d** is described. Compounds **1a** and **2a** exhibit trypanocidal activity in the range of  $IC_{50} = 0.42 \mu\text{M}$  and  $IC_{50} = 0.80 \mu\text{M}$ , respectively. Both of these derivatives bear a lipophilic end, which consists of a 4-(1-adamantyl) phenyl or a 3-(1-adamantyl)phenyl moiety, a 1,3-thiazole ring and a functional end, which comprises of an alkylamine and can be considered as promising candidates for the treatment of *Trypanosoma brucei* infections.

## Introduction

The African sleeping sickness and the Chagas disease are two of the major neglected tropical diseases (NTDs). The trypanosomiasis are vector-borne parasitic infections caused by flagellated protozoa of the class Kinetoplastida.<sup>1</sup> There are two species of human-infectious trypanosomes, *Trypanosoma brucei*, that causes human African trypanosomiasis (HAT), and *Trypanosoma cruzi*, which is responsible for the Chagas disease. HAT is prevalent in sub-Saharan Africa, transmitted by the bite of a tsetse fly infected with one of the two subspecies, *Trypanosoma brucei gambiense* or *Trypanosoma brucei rhodesiense*. The Chagas disease is spread predominantly in Latin and Central America by *Triatominae* bugs infected with *T. cruzi*.<sup>2,3</sup> Trypanosomiasis, as with other NTDs, are becoming public health problems in non-endemic countries, as a result of travel and migration. New drugs are urgently required, as those that are currently available are characterized by side-effects and treatment failures.<sup>4,5</sup>

Various initiatives<sup>6–8</sup> have led to the discovery of promiscuous trypanocidal derivatives from phenotypic high-throughput screening of a number of compound libraries. These have been further refined and optimized to enhance drug-like properties. The Walter and Eliza Hall Institute (WEHI), in partnership with the Drugs for Neglected Diseases initiative (DNDi), and the Genomics Institute of the Novartis

Research Foundation (GNF) have described the amide and urea derivatives of thiazolethylamines **I**, **II** and sulfonamides **III**, shown in Fig. 1, as potent trypanocidals.<sup>6,7</sup>

Based on these findings and our involvement in the adamantane chemistry,<sup>9–20</sup> we report herein on the chemistry and biology of thiazole derivatives of the general type scaffold **IV**. The thiazole moiety is an important pharmacophore in many compounds used against several tropical infectious diseases.<sup>21</sup>

Scaffold **IV** includes a 1,3-thiazole moiety, which is 2,4-disubstituted. One substituent is the lipophilic end of the scaffold, which consists of a phenyl ring bearing fluoro- and 1-adamantyl-functionalities. The 4-(1-adamantyl)phenyl substituent has been proven to be well tolerated and is endowed with trypanocidal properties.<sup>22</sup> The thiazole ring bears a variety of functional groups (Fig. 2).

2-Phenylthiazol-4-ethylamines **1a–d** and **2a–d** share the same structural features, apart from the relative position of the 1-adamantyl core and the addition of a fluoro-substituent in series **1**. Fluorine alters the biophysical and chemical properties, such as lipophilicity, acidity, as well as the reactivity

Fig. 2 Novel thiazole derivatives 1a–j, 2a–h, 3a–e, 4a–d.

and conformation of the substituted derivatives.<sup>23</sup> In 2018, 18 out of the 38 small drug molecules, that were approved by the FDA, contain a fluorine atom.<sup>24,25</sup> Derivatives 3 differ in the thiazole moiety compared to adducts 1 and 2. The 2,4-substituents of the thiazoles 2a, c have their positions switched in derivatives 3c, d. The functionalization of the amino-end of congeners 1 involves various amide (aromatic and non-aromatic) and urea substituents. In adducts 2, the polar heads were translocated to the functional end of the general type scaffold IV. The length of the side chain of derivatives 2e, 2g and 3e was kept at the distance of three atoms (2C and 1N and *vice versa*), which in the derivatives I, II and III was found to be the optimal length for enhanced trypanocidal potency.<sup>6–8</sup> The length of the R group is different in adducts 2f, h and 3a, b. 2-Aminothiazole (adduct 3a), is a frequent-hitting fragment in biophysical binding assays.<sup>26</sup> Moreover, an analogous thiazole guanidinium system of derivative 3e has been used as a substitute for other aromatic rings improving biological activity.<sup>27</sup>

The relative position of the adamantane cage, the phenyl ring and the thiazole moiety was altered in derivatives 4a, c.

Compounds 4a, c bear the same thiazole ring substituents as derivatives 2 and 3. Additionally, the adamantane core was replaced in the camphor skeleton in adducts 4b, d. The latter molecules are sulfonamides in alignment with the scaffolds of compounds III.<sup>7</sup>

## Results and discussion

### Synthesis

The 4-substituted-2-[3-(adamant-1-yl)-4-fluorophenyl]thiazoles 1a–j were synthesized as shown in Scheme 1. As starting material, for the synthesis of thiazoles 1a–j, the (3-adamant-1-yl)-(4-fluorophenyl)boronic acid (6) was used. The reported method for the preparation of the boronic acid 6 (ref. 28) has been modified, by changing the reaction times. The synthetic route involved a Suzuki–Miyaura palladium-catalyzed coupling between the boronic acid 6 and the 2-thiazole bromide 7 (ref. 6) to provide the phthalimide protected adamantane derivative 8. The hydrazinolysis of phthalimide derivative 8 led to the deprotected parent compound 2-{2-[3-(adamant-1-yl)-4-fluorophenyl]thiazol-4-yl}ethan-1-amine (1a), which was subsequently methylated, dimethylated,<sup>29</sup> acylated and carbamoylated to deliver adducts 1b–j, *via* the procedures shown in Scheme 1.

The synthesis of the 4-substituted-2-[4-(adamant-1-yl)phenyl]thiazoles 2a–d was realized following two synthetic pathways, as illustrated in Scheme 2. The key-compound for the preparation of the thiazoles 2a–h, the 2-{2-[[2-(adamant-1-yl)phenyl]thiazol-4-yl]ethyl}isoindoline-1,3-dione (10) was obtained *via* two different synthetic routes. The first involves a Suzuki–Miyaura<sup>30</sup> palladium-catalysed coupling between the 4,4,5,5-tetramethyl-2-[4-(adamant-1-yl)phenyl]-2H-1,3,2-dioxaborolane (9)<sup>31</sup> and the 2-thiazole bromide 7, which led to the protected precursor 10. The second synthetic approach, towards the thiazole adduct 10, was based on the Hantzsch condensation<sup>32</sup> of thiobenzamide 14 with the  $\alpha$ -bromoketone 15.<sup>6</sup> Our lab has previously published the preparation of the 4-(adamant-1-yl)benzoic acid (12),<sup>31</sup> which was now obtained by a different transition metal ion catalyzed oxidation of 1-(4-tolyl)adamantane (11).<sup>33</sup> The reported method of oxidation<sup>34</sup> was modified as the reaction mixture was bubbled with oxygen gas and heated at 105 °C for 6 h. The benzoic acid 12 was subsequently converted to the corresponding benzamide 13 and the thiobenzamide 14. Comparing the two methods, the first involves 5 steps (17% total yield), while the second 6 steps (25% total yield), a more facile work-up and cheaper

reagents. The parent thiazole **2a** was methylated, dimethylated and acetylated to the respective congeners **2b–d**, as previously shown.

The functionalized thiazoles **2e–h** were obtained by the route shown in Scheme 3. The thiobenzamide **14** was condensed with 1,3-dichloroacetone and 4-chloroacetoacetate, under Hantzsch reaction conditions, to give the chloromethylthiazole **15** and the thiazolethyl acetate **16**, respectively. Treatment of the chloromethylthiazole **15** with KCN or KSCN led to the respective cyanide **2e** and the thiocyanide **2f**. The thiazolethyl acetate **16** was reduced to the corresponding alcohol **2g**, which was then converted to the azide **2h**, *via* activation of the methanesulphonyl derivative **17**.

The synthesis of the 2-substituted-4-{4-(adamant-1-yl)phenyl}thiazoles **3a–d** and the guanidyl derivative **3e**, is shown in Scheme 4. (1-Phenyl)adamantane (**18**)<sup>4</sup> was acylated under Friedel–Crafts reaction conditions<sup>36</sup> to deliver the corresponding  $\alpha$ -bromoketone **19**, which *via* a Hantzsch condensation with the appropriate reagent, thiourea,<sup>37</sup> thioamides **20**,<sup>38</sup> **21** (ref. 7) and guanylthiourea provided the desired thiazoles **3a–c** and **3e**, respectively. The dimethylthiazole **3d** was prepared from the parent thiazole **3c**, as shown before.

The 1-adamantylcarbonylamides **4a, c** and the ( $\pm$ )-10-camphorsulfonyl amides **4b, d** were obtained upon coupling the commercially available 1-adamantylcarboxylic acid and ( $\pm$ )-10-camphorsulfonyl chloride with the 2-phenylthiazol-4-ethylamine (**22**)<sup>6</sup> and the 4-phenylthiazol-2-ethylamine (**23**),<sup>7</sup> respectively. The acid reacted in the presence of the coupling reagent HBTU, while the chlorides reacted without the aid of any activating reagent (Scheme 5).

### Pharmacology

The 27 new thiazole derivatives were tested for their activity against the bloodstream form *Trypanosoma brucei* and the results are shown in Table 1.

It is apparent from the test results that the ethylamines **1a–c** exhibit the highest activity among the new 2,4-disubstituted arylthiazoles. Bulkier substituents than the methyl group at the amino end have a negative impact on trypanocidal activity. Amido adducts (alkyl **1d** and **1c**, the aromatic **1f** and **1g** and the heteroaromatic **1h**) and the ureido derivatives, **1i** and **1j**, have a non-significant activity. The same pattern is also observed in the 2 series, as compounds

**Scheme 3** Reagents and conditions: (a) 1,3-dichloroacetone, acetone, reflux, 18 h, 75%; (b) KCN, anh. DMF, 60 °C, 36 h (**2e**: 41%) or KSCN, EtOH, 45 °C, 18 h (**2f**: 67%); (c) 4-chloroacetoacetate, i-PrOH, autoclave, 120 °C, 18 h, 92%; (d) i. LiAlH<sub>4</sub>, THF, r.t. 2 h, ii. EtOH, H<sub>2</sub>O, NaOH 10%, 0 °C, 80%; (e) MsCl, Et<sub>3</sub>N, DCM, 0 °C then r.t. 18 h, 95%; (f) NaN<sub>3</sub>, anh. DMF, 60 °C, 2 h, 65%.

**Scheme 4** Reagents and conditions: (a)  $\text{BrCOCH}_2\text{Br}$ ,  $\text{AlCl}_3$ , DCM,  $-10\text{ }^\circ\text{C}$  then r.t. 18 h, 57%; (b) appropriate thiobenzamide **20** (**3b**: 36%), **21** (**3c**: 85%), *i*-PrOH, autoclave,  $120\text{ }^\circ\text{C}$  18 h or thiourea (**3a**: 88%), EtOH, reflux, 18 h; (c) MeONa,  $\text{CH}_3\text{COOH}$ , HCHO 38% in  $\text{H}_2\text{O}$ ,  $\text{NaBH}_3\text{CN}$ , MeOH, r.t. 18 h, 85%; (d) guanylthiourea, EtOH, reflux, 18 h, 89%.

**2a–c** are *ca.* 20 times more active than their acetamido congener **2d**. Comparing series **1** and **2**, it becomes apparent that the fluorine substitution has little positive effect on the activity. The dimethylamino isomeric thiazoles **2c** and **3d** present almost the same potency, while the nor-derivatives, the isomeric thiazoles **2a** and **3c**, show a substantial difference in potency. The 2-phenylthiazol-4-ethylamines **1a, c** and **2a, c** seem to be, in general, more potent than their isomeric 4-phenylthiazol-2-ethylamines **3c** and **3d**. The decrease of the length of the side chain does not enhance activity. Methanamine **3b** bears two atoms (carbon and nitrogen) in its side chain and is twice as potent as the 2-aminothiazole **3a**, which has only one nitrogen atom. The polar functionalization of the side chain did not improve the trypanocidal activity. The azido and cyano-tailored derivatives **2e** and **2h** are less potent, and the thiocyanate **2f**, the ethanol **2g** and the guanyl derivative **3e** exhibit modest activity. The change in the relative position of the adamantane cage, the phenyl ring and the thiazole moiety, in adducts **4a** and **4c**, did not lead to activity enhancement. Last, the replacement of the adamantane skeleton by the camphorsulfonyl moiety in derivatives **4b** and **4d** has not led to antitrypanosomal enhancement. The 2,4-disubstituted arylthiazole adamantane derivatives, the ethylamines **1a–c** and **2a–c**, present a notable pharmacological profile, which merits further investigation in terms of activity and toxicity. These findings suggest that an aliphatic amine moiety at the side chain is mandatory to achieve notable trypanocidal activity. This amine group is positively charged at the cytosolic pH, which is not the case for all the other polar heads tested. The presence of this particular group might also enhance the cellular accumulation into the protozoa, as it is reported in the case of bacteria.<sup>39,40</sup> Thus, the ethylamines **1a–c** and **2a–c** seem to exhibit promis-

ing trypanocidal properties, although further optimisation will be necessary to reduce their cytotoxicity and to develop a more drug-like profile.

## Conclusions

In this work, we describe the synthesis of a new series of aromatic 2,4-disubstituted 1,3-thiazole analogues with trypanocidal potency. Among their congeners, the 2-phenylthiazol-4-ethylamines **1a–c** and **2a–c** presented the most significant trypanocidal activity against *T. brucei*. Analogues **1a** and **2a** exhibit antitrypanosomal activity in the range of  $\text{IC}_{50} = 0.42\text{ }\mu\text{M}$  and  $\text{IC}_{50} = 0.80\text{ }\mu\text{M}$ , respectively. Primary amine **2a** is less potent than its congener **1a**, but exhibits higher selectivity, which is a promising perspective for designing new trypanocidals in the future. Both of these classes of derivatives bear a lipophilic end, which consists of a 4-(1-adamantyl)phenyl or a 3-(1-adamantyl)phenyl moiety, a 1,3-thiazole ring and a functional end, which comprises of an alkylamine. The addition of the adamantane ring into the scaffold of the thiazole reference compounds<sup>6,7</sup> has not improved their pharmacological profile, in terms of activity and toxicity. On the other hand, the new congeners exhibit promising trypanocidal properties that merit further investigation. These tailored-made structural modifications will be implemented in the future in the design of trypanocidal agents.

## Experimental part

### Biology

**Cytotoxic activity against rat skeletal myoblast L6 cells.** Cytotoxicity against mammalian cells was assessed using microtitre plates. Briefly, L6 cells (a rat skeletal muscle line) were seeded at  $1 \times 10^4\text{ mL}^{-1}$  in 200  $\mu\text{L}$  of growth medium containing 7 different compound concentrations in a range previously established to encompass both the  $\text{IC}_{50}$  and  $\text{IC}_{90}$  values. The plates were incubated for 6 days at  $37\text{ }^\circ\text{C}$  and 20  $\mu\text{L}$  Alamar Blue (Biosource UK Ltd) was then added to each well. After an additional 8 hours incubation, the fluorescence was determined using a FLUOstar Omega fluorescent plate reader (BMG Labtech). Inhibition of growth was calculated by comparison with control values and  $\text{IC}_{50}$  and  $\text{IC}_{90}$  values were determined in triplicate using linear regression analysis.

**Scheme 5** Reagents and conditions: (a) appropriate chloride  $\text{NEt}_3$ , DCM or THF, r.t. 18 h, (**4a**: 49%, **4b**: 50%, **4d**: 81%); (b) 1-adamantane-carboxylic acid HBTU, DIPEA, DCM/DMF, r.t. 24 h, 94%.

<sup>a</sup> IC<sub>50</sub> and IC<sub>90</sub>; concentration that inhibits growth by 50% and 90%. <sup>b</sup> S.I.; selectivity index, the ratio of IC<sub>50</sub> values obtained with L6 cells and *T. brucei* respectively.

**Trypanosoma brucei** culturing and drug testing. Blood-stream form *T. brucei* (strain 427) were cultured at 37 °C in modified Iscove's medium. Trypanocidal activity was assessed by growing parasites in microtiter plates in the presence of various drug concentrations. Parasites were seeded at 0.25 × 10<sup>5</sup> mL<sup>-1</sup> in 200 μL of growth medium containing 7 different compound concentrations in a range previously established to encompass both the IC<sub>50</sub> and IC<sub>90</sub> values. The plates were incubated for 48 hours at 37 °C and 20 μL Alamar Blue was then added to each well. After an additional overnight incubation, the fluorescence was determined. Inhibition of growth was calculated by comparison with control values and IC<sub>50</sub> and IC<sub>90</sub> values were determined in triplicate using linear regression analysis.

**Synthetic procedures.** All chemicals and solvents were obtained from commercial suppliers and used without further purification. Reactions were monitored by thin layer chromatography. Melting points were determined on a Büchi 530 apparatus and are uncorrected. Infrared (IR) spectra were recorded on a Perkin-Elmer 833 spectrophotometer. <sup>1</sup>H-NMR spectra recorded on a Bruker DRX 400 (400 MHz) spectrometer and <sup>13</sup>C-NMR spectra were taken at 50 MHz on Bruker AC 200 (200 MHz) spectrometer and at 150 MHz on Bruker Avance 600 spectrometer (600 MHz). All NMR spectra were taken in deuteriochloroform or hexadeuterodimethyl sulfoxide and the chemical shifts are reported in ppm. Elemental analyses (C, H, N) were carried out by the Institute of Chemical

Biology, NHRF, Greece and the results obtained had a maximum deviation of ±0.4% from the theoretical value.

**3-[(1-Tricyclo[3.3.1.1<sup>3,7</sup>]decyl)-4-fluorophenyl]boronic acid (6).** *n*-BuLi (4 mL, 1.6 M in hexanes, 6.4 mmol) was added in one portion to a stirred solution of the bromide 5 (ref. 28) (1.25 g, 4.04 mmol) in anhydrous THF (20 mL), at -73 °C, under an argon atmosphere. The mixture was then stirred at -80 °C for 25 min prior to addition of (i-PrO)<sub>3</sub>B (3 mL, 12.1 mmol). The reaction mixture was stirred for 35 min at the same temperature and subsequently at ambient temperature overnight. Next, dilute HCl (20 mL) was added dropwise at 0 °C, the mixture was stirred for 30 min at room temperature and then extracted with EtOAc (3 × 20 mL). The combined organic layers were washed with water, dried over Na<sub>2</sub>SO<sub>4</sub> and the solvent evaporated under reduced pressure. The residue was crystallized from *n*-hexane to give compound 6 (1.1 g, 90%) as a white solid, which was used directly in the next step. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ 8.18 (d, *J* = 8.7 Hz, 1H, 2-Har), 8.03 (dd, *J* = 8.4, 4.2 Hz, 1H, 6-Har), 7.12 (dd, *J* = 8.1, 7.8 Hz, 1H, 5-Har), 2.12 (bs, 3H, 3,5,7-Had), 2.06 (bs, 6H, 2,8,9-Had), 1.79 (br.s, 6H, 4,6,10-Had).

**2-[2-[(1-Tricyclo[3.3.1.1<sup>3,7</sup>]decyl)-4-fluorophenyl]thiazol-4-yl]ethyl]isoindoline-1,3-dione (8).** Argon was bubbled for 20 min through a stirred mixture of boronic acid 6 (250 mg, 0.9 mmol), the 2-thiazole bromide 7 (ref. 6) (161 mg, 0.45 mmol), toluene (5 mL) and Na<sub>2</sub>CO<sub>3</sub> (2 M, 5 mL). The reaction mixture was then heated to 80 °C, under an argon atmosphere,

Pd(PPh<sub>3</sub>)<sub>4</sub> (107 mg) was added and heating was continued overnight. After cooling, the reaction mixture was extracted with EtOAc (3 × 25 mL) and the combined organics were washed with water dried over Na<sub>2</sub>SO<sub>4</sub> and the solvent removed *in vacuo*. The residue was purified by column chromatography. Elution with 10–20% EtOAc in hexanes afforded compound **8** as a foamy solid (175 mg, 80%). <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ 7.85–7.79 (m, 2H, 3',4'-Har), 7.76 (dd, *J* = 7.7, 2.2 Hz, 1H, 2-Har), 7.73–7.68 (m, 2H, 2',5'-Har), 7.64–7.58 (m, 1H, 6-Har), 6.71 (s, 1H, 5-Hth), 6.96 (dd, *J* = 12.7, 8.3 Hz, 1H, 5-Har), 4.11 (t, *J* = 7.0 Hz, 2H, CH<sub>2</sub>N), 3.23 (t, *J* = 7.0 Hz, 2H, CH<sub>2</sub>), 2.10 (br. s, 3H, 3,5,7-Had), 2.04 (bs, 6H, 2,8,9-Had), 1.79 (br.s, 6H, 4,6,10-Had). <sup>13</sup>C NMR (150 MHz, DMSO-*d*<sub>6</sub>) δ 167.2 (C=O), 166.6 (2-Cth), 162.8 (d, *J* = 251.9 Hz, 4-Car), 152.8 (4-Cth), 137.5 (d, *J* = 11.4 Hz, 3-Car), 132.9 (1',6'-Car), 132.8 (3',4'-Car), 129.2 (1-Car), 126.2 (d, *J* = 8.4 Hz, 2-Car), 125.1 (6-Car), 122.2 (2',5'-Car) 117.5 (d, *J* = 25.4, 5-Car), 116.4 (5-Cth), 40.5 (2,8,9-Cad), 38.4 (NCH<sub>2</sub>), 36.2 (1-Cad), 36.0 (4,6,10-Cad), 28.8 (CH<sub>2</sub>), 28.2 (3,5,7-Cad). **Ethyl 2-{2-[4-(1-Tricyclo[3.3.1.1<sup>3,7</sup>]decyl)phenyl]thiazol-4-yl]-acetate (16).** 4-Chloroacetoacetate (700 mg, 2.43 mmol) was added to a stirred mixture of thiobenzamide **14** (1 g, 3.68 mmol) in *i*-PrOH (8 mL), and the reaction mixture was stirred overnight, at 110 °C, in an autoclave. The solvent was then removed *in vacuo* and the resulting residue was dissolved in EtOAc and washed with water, a saturated aqueous solution of NaHCO<sub>3</sub> and brine. The organic layer was then dried over MgSO<sub>4</sub> and the solvent evaporated under vacuum. The resulting oil was triturated with EtOAc/hexanes to afford compound **16** as a light orange solid (1.3 g, 92%) which was used in the next step without further purification.

**2-{2-[4-(1-Tricyclo[3.3.1.1<sup>3,7</sup>]decyl)phenyl]thiazol-4-yl]ethanol (2g).** To a stirred suspension of LiAlH<sub>4</sub> (85 mg, 2.23 mmol) in anhydrous THF (5 mL), was added dropwise a solution of compound **16** (170 mg, 0.44 mmol) in anhydrous THF (3 mL), under an argon atmosphere and then the reaction mixture was stirred at ambient temperature for 2 h. Next, the mixture was cooled in an ice bath and ethanol, water and a NaOH (10%) solution were added in order. The resulting suspension was then filtered, the filtrate was evaporated *in vacuo* and extracted with DCM. The organic layer was then washed with water, dried over MgSO<sub>4</sub> and the solvent evaporated to afford compound **2g** as an off white solid (120 mg, 80%). M.p.: 93–94 °C. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  7.86 (d,  $J = 8.4$  Hz, 2H, 2,6H-ar), 7.42 (d,  $J = 8.4$  Hz, 2H, 3,5-Har), 6.94 (s, 1H, 5-Hth), 3.99 (s, 2H, CH<sub>2</sub>OH), 3.68 (s, 1H, OH), 3.02 (t,  $J = 5.5$  Hz, 2H, CH<sub>2</sub>), 2.12 (s, 3H 3,5,7-Had), 1.95 (d,  $J = 11.0$  Hz, 6H, 2,8,9-Had), 1.83–1.73 (m, 6H, 4,6,10-Had). <sup>13</sup>C NMR (150 MHz, CDCl<sub>3</sub>)  $\delta$  168.5 (2-Cth), 155.7 (4-Cth), 153.8 (1-Car), 130.7 (4-Car), 126.3 (2,6-Car), 125.5 (3,5-Car), 113.4 (5-Cth), 62.1 (CH<sub>2</sub>OH), 43.0 (2,8,9-Cad), 36.7 (4,6,10-Cad), 36.4 (1-Cad), 33.8 (CH<sub>2</sub>), 28.9 (3,5,7-Cad). Anal. calcd for C<sub>21</sub>H<sub>25</sub>NOS: C, 74.30; H, 7.42; N, 4.13 found C, 74.53; H, 7.31; N, 3.95.

**2-{2-[4-(1-Tricyclo[3.3.1.1<sup>3,7</sup>]decyl)phenyl]thiazol-4-yl]ethyl}-methanesulfonate (17).** To a stirred solution of the alcohol **2g** (170 mg, 0.50 mmol) and Et<sub>3</sub>N (85  $\mu$ L) in DCM (2 mL), MsCl (50  $\mu$ L) was added dropwise at 0 °C. The reaction mixture was stirred at ambient temperature overnight. 1 M hydrochloride solution was added, into the reaction mixture, which was then extracted with EtOAc and the organic layer was dried over MgSO<sub>4</sub> and the solvent evaporated to afford compound **17** as a yellow solid (170 mg, 95%), which used in the next step without further purification.

**2-[4-(1-Tricyclo[3.3.1.1<sup>3,7</sup>]decyl)phenyl]-4-(2-azidoethyl)-thiazole (2h).** To a stirred solution of the mesylate **17** (180 mg, 0.42 mmol) in anhydrous DMF (2 mL), was added NaN<sub>3</sub> (40 mL) and the reaction mixture was heated at 60

°C, for 2 h. The reaction mixture was then extracted with EtOAc and the organic layer was dried over MgSO<sub>4</sub> and evaporated *in vacuo*. The resulting residue was then purified by column chromatography. Elution with 20% EtOAc in hexanes afforded compound **2h** as a white solid (100 mg, 65%). <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  7.87 (d,  $J = 8.6$  Hz, 2H, 2,6H-ar), 7.42 (d,  $J = 8.5$  Hz, 2H, 3,5-Har), 6.99 (s, 1H, 5-Hth), 3.70 (t,  $J = 6.9$  Hz, 2H, CH<sub>2</sub>N), 3.09 (t,  $J = 7.1$  Hz, 2H, CH<sub>2</sub>), 2.12 (s, 3H, 3,5,7-Had), 1.93 (d, 6H, 2,8,9-Had), 1.85–1.71 (m, 6H, 4,6,10-Had). <sup>13</sup>C NMR (75 MHz, CDCl<sub>3</sub>)  $\delta$  168.5 (2-Cth), 154.0 (4-Cth), 153.7 (1-Car) 131.1 (4-Car), 126.5 (2,6-Car), 125.6 (3,5-Car), 114.6 (5-Cth), 50.7 (CH<sub>2</sub>N<sub>3</sub>), 43.2 (2,8,9-Cad), 36.9 (4,6,10-Cad), 36.6 (1-Cad), 31.5 (CH<sub>2</sub>), 29.0 (3,5,7-Cad).
