Diketopyrrolopyrrole-based (DPP-based) polymers are a very important class of materials for both organic solar cells (OSCs) and organic field-effect transistors (OFETs). Here we report an optimised synthesis of fluorinated dithienyl-diketopyrrolopyrrole (fDT-DPP) and three new highly fluorinated fDT-DPP-based materials obtained from direct heteroarylation polymerization (DHAP). This study confirms the properties of the fluorine atom in a polymer, activation of the α -position hydrogen on thiophene moieties, decreasing HOMO and LUMO energy, lower bandgaps and modification of the solubility and morphology of the materials.

Introduction

Since the first report on the synthesis of 3,6-diphenyl, 2,5-dihydro-pyrrolo[3,4-*c*]pyrrole-1,4-dione by Farnum *et al.* in 1974,¹ DPP-based π -conjugated polymers have been extensively studied due to their good performance in both organic solar cells (OSCs)² and organic field-effect transistors (OFETs).^{3,4} Modifications of the aromatic moieties can highly modulate the electro-optical properties of the resulting copolymers and, in particular, dithienyl-DPP (DT-DPP) has attracted increasing interest.^{5,6} Fluorination of the conjugated backbone has also proven to be effective to fine-tune the properties of these organic materials.^{7–11} The electronegativity of the fluorine atom lowers both the HOMO and LUMO energy levels without creating additional steric hindrance.^{12,13}

Recently, our group has developed a fluorinated DT-DPP and reported fDT-DPP copolymers obtained *via* direct heteroarylation polymerization (DHAP), which showed very promising performance in OFET.¹⁴ The fDT-DPP was obtained by classical condensation of diisopropyl succinate with 4-fluoro-2-cyanothiophene as a key intermediate in 6 steps with a satisfactory 21% overall yield (Scheme 1, eqn (1)). Nevertheless, this synthetic pathway was not easily applicable to the large-scale preparation of this important monomer. Very recently, Wang *et al.* proposed a nonconventional stepwise synthesis of symmetrical and

Scheme 1 Previous synthesis of fDT-DPP by Leclerc's group (eqn (1)) and Wang's group (eqn (2)).

non-symmetrical fDPP and confirmed the properties of fDT-DPP copolymers (Scheme 1, eqn (2)).¹⁵ To fully study the potential of this monomer, we report here optimisation of its synthesis and application to new highly fluorinated DPP based copolymers.

Results and discussion

Optimization of fDT-DPP synthesis

As shown in Scheme 2 and based on our previous studies,¹⁴ 3-bromo-2-(dimethyloctylsilyl)thiophene (5) was synthesized from a lithiation reaction of commercially available 2,3-dibromothiophene (1) in diethyl ether (at -78 °C) followed by addition of *n*-octyldimethylchlorosilane and isolated after reduced pressure distillation in 85% yield.

Scheme 2 New fDT-DPP synthesis in 4 steps.

The fluorination of compound (5) was the most delicate step in our previous synthesis due to the difficulty in separating hydrogenated and fluorinated thiophene by classical chromatography on silica gel. The reaction had to be realized at $-100\text{ }^{\circ}\text{C}$ to obtain a good selectivity for the fluorinated product which is very limiting for application in large scale synthesis. To solve these problems, *tert*-BuLi was used instead of *n*-BuLi for the monolithiation of compound (5) followed by a dropwise addition of a cold solution of NFSI in THF to increase the solubility of the fluorine donor. The reaction can now be realised at $-78\text{ }^{\circ}\text{C}$, a more easily processable temperature, and a better conversion was observed due to the highest reactivity of *tert*-BuLi. The purification was also easier and the reaction can be applied at a larger scale with high purity and a very satisfying 56% yield.

As described later, compound (6) is also an important intermediate for the synthesis of various fluorinated bithiophene units.

Compound (6) could then be converted to compound (7) by a direct cyanation reaction with phenyl cyanate with 80% yield. This procedure reduces by one step the usual formylation/cyanation pathway. Finally, DPP was obtained by a classical cyclization with isopropyl succinate following an already described procedure.¹⁶ Due to the volatility of fluorinated thiophene, silylated compound (7) was directly used in this transformation and the product was deprotected *in situ* by quenching the reaction with dry MeOH. The desired fDT-DPP was isolated with 83% overall yield. These optimizations increased the global yield of the synthesis to 32% and reduced the number of steps to 4.

Design of fDT-DPP-based copolymers

To pursue our study on fluorine atom effects on the properties of fDT-DPP-based copolymers, several new monomers (see Schemes 3 and 4) and conjugated copolymers (see Scheme 5) were designed and investigated for their properties in OFETs. Their structures were chosen according to a recent work published by Wang *et al.*¹⁷ on non-fluorinated DPP analogs.

Monomer preparation

Due to the known low solubility of fluorinated conjugated polymers and with the aim of making a relevant comparison with Wang's work,¹⁷ large branched 4-octadecyldocosyl and

Scheme 3 Alkylation and bromination of fDT-DPP.

Scheme 4 Preparation of fluorinated comonomers.

4-pentadecylnonadecyl side chains were introduced on fDT-DPP in DMF in the presence of K_2CO_3 with 45 and 53% yield. Alkylated fDT-DPP was then brominated by *N*-bromosuccinimide at $50\text{ }^{\circ}\text{C}$ in degassed chloroform to obtain the corresponding monomers (9) in 73 and 50% yields, respectively (Scheme 3).

As reported in Scheme 4, monomer (10) and new monomer (12) were also easily prepared from compound (6) by direct oxidative coupling with CuCl_2 with 64% yield or by formylation followed by a McMurry condensation with a 46% overall yield. 3,3',4,4'-tetrafluoro-2,2'-bithiophene (14) can be prepared from 3,4-dibromothiophene following previously described procedures.¹⁸

Polymer synthesis

After optimizations (see the ESI[†]), copolymers **P1**, **P2** and **P3** (Scheme 4) could be prepared by direct (hetero)arylation polymerization (DHAP) using $\text{Pd}(\text{OAc})_2$ in a toluene/DMAc mixture at $120\text{ }^{\circ}\text{C}$ for 16 h. After precipitation in methanol, the polymers were purified by successive Soxhlet extractions. The molecular weights of the resulting polymers were measured by high temperature size exclusion chromatography (SEC) with polystyrene as standard and 1,2,4-trichlorobenzene as the eluent at $110\text{ }^{\circ}\text{C}$ and the results are listed in Table 1. Surprisingly, in all cases, M_n is significantly lower than the non-fluorinated analogs described by Wang *et al.*¹⁵ even with longer reaction times. Clearly, fDT-DPP monomers are highly reactive towards DHAP polymerization but the brominated ones are by far less reactive.¹⁴

Scheme 5 fDT-DPP-based copolymers synthesized by DHAP.

The difference could also be explained by a higher rigidity induced by the fluorine atom on the DT-DPP moiety which reduces the solubility of the resulting copolymers.

Polymer characterization

These polymers show good thermal stability with 5% weight loss temperature above 400 °C (see the ESI†). As described for the non-fluorinated analogues, broad thermal transitions between ~ -10 and 40 °C have been observed in the DSC curves, which are probably related to the melting of the long alkyl side chains (see the ESI†).¹⁹

Optical absorption and electrochemical properties

As observed by Wang *et al.*,¹⁷ the more electron-rich nature of bis-thienylethene relative to the bithienyl group leads to a slightly red shifted maximum of absorption for **P1** at 806 nm compared to 791 nm for **P2** (see Table 1 and Fig. 1). It could also explain the decrease of energy levels moving from -5.35 to -5.51 eV for the HOMO and from -3.43 to -3.54 eV for the LUMO for **P1** and **P2**, respectively. As expected, addition of a fluorine atom on the conjugated backbone decreased the energy level. If one compares **P2** and the non-fluorinated DT-DPP analogue P4F2T-C40,¹⁷ we can see that the position of the fluorine atom on the skeleton has very little impact on the optical and electrochemical properties of the polymer. In fact, the absorbance maxima are similar, 791 and 799 nm, the HOMO and LUMO energy levels have slightly changed and the electrochemical bandgaps are very close.

Interestingly, the addition of extra fluorine atoms has significant effects. The absorption maximum of **P3** is blue-shifted by 28 nm in comparison to **P2** and the HOMO and LUMO energy levels are both lowered. One can notice a decreased optical band gap for **P3** and no secondary absorption shoulder in the UV-vis absorption spectrum in film or in solution.

Fig. 1 Normalized UV-vis absorption spectra of the polymers in thin films and in chloroform solution.

Film morphology

The film microstructures play important roles in determining the device performances. Therefore, two-dimensional grazing-incidence X-ray diffraction (2D-GIXD) (see the ESI†) was performed and the results are depicted in Fig. 2.

From the out of plane line-cuts, (100) and (200) diffraction peaks were observed for spin-coated thin films of all these three polymers, indicating that all of them adopt edge-on packing with respect to the substrate plane in thin films, which was preferred for charge transportation in OFET devices. The lamella packing *d*-spacings of **P1**, **P2** and **P3** were 27.2, 32.2 and 31.9 Å, respectively. **P1** showed a higher (100) diffraction peak than that of **P2** or **P3**, suggesting that **P1** has much higher crystallinity compared to the other two polymers, which was beneficial for charge transport in the thin films. Unfortunately, no in-plane diffraction peaks were found in the films of all these three polymers, indicative of their lower packing order in the in plane direction, which may be an explanation for the

Table 1 Optical and electrochemical properties of the polymers

moderate mobility of $ca. 10^{-3}$ – $10^{-2} \text{ cm}^2 \text{ V}^{-1} \text{ s}^{-1}$ for these polymers, which will be discussed in the next section.

Semiconducting properties

Bottom gate and bottom contact OFET devices were fabricated to evaluate the semiconducting properties of the polymers.

The mobility (μ) was calculated in the saturation regime and the results are summarized in Table 2. All polymers exhibited ambipolar properties with slightly better performances in the p-channel operation. Among them, **P1**, which carries a fluorinated bis-thienylethene group, showed the highest hole and electron mobility of 4.10×10^{-2} and $7.63 \times 10^{-3} \text{ cm}^2 \text{ V}^{-1} \text{ s}^{-1}$, respectively, in agreement with the 2D-GIXD results. The highly fluorinated polymer, **P3**, showed the lowest hole and electron mobility of 2.03×10^{-3} and $2.92 \times 10^{-4} \text{ cm}^2 \text{ V}^{-1} \text{ s}^{-1}$, respectively, which were an order of magnitude lower than those of **P1** and **P2**. This may have resulted from the lowest solubility (~ 2 – 3 mg ml^{-1}) of **P3**, which would have a negative influence on the quality of the film. It should be noted that they all showed ideal transfer curves with a linear relationship between the square root of drain current ($I_{\text{DA}}^{1/2}$) and gate voltage (V_{G}) (see ESI[†]), implying that the mobility values obtained are reliable. On the other hand, the ratios of $\mu_{\text{h}}/\mu_{\text{e}}$ of **P1**, **P2** and **P3** were 5.37, 8.89 and 6.95, respectively. **P1** showed the most balanced hole and electron transport properties. The above results indicated that **P1** has the best OFET performance among the three polymers, which may be due to the introduction of a vinyl group improving the planarity of the polymer

Table 2 OFET device performance of the polymers

	p-Channel		n-Channel		$\mu_{\text{h}}/\mu_{\text{e}}$
	$\mu_{\text{max}} (\mu_{\text{avg}})$ ($\text{cm}^2 \text{ V}^{-1} \text{ s}^{-1}$)	$I_{\text{on/off}}$	$\mu_{\text{max}} (\mu_{\text{avg}})$ ($\text{cm}^2 \text{ V}^{-1} \text{ s}^{-1}$)	$I_{\text{on/off}}$

All polymer films were annealed at 200 °C for 15 min under argon.

backbone, which is consistent with the most red-shifted absorption spectra.

Conclusions

In summary, we successfully optimized the fDT-DPP synthesis by reducing the number of steps and increasing the total yield to 32%. The monomer could be used in the preparation of three new highly fluorinated copolymers by DHAP. Characterization of these polymers confirms the fluorine effect on the electro-optical properties of materials. **P3** showed the most significant decreases in the HOMO and LUMO energy levels and a bandgap diminution. The low solubility of this highly fluorinated polymer also induced morphology changes that explained low hole and electron mobilities. These ambipolar copolymers with strong absorption between 600 and 800 nm could also be utilized as p-type or even n-type semiconductors in various organic solar cells.

Experimental

3-Bromo-2-(dimethyloctylsilyl)thiophene (5)

2,3-Dibromothiophene (20 g, 82.66 mmol) is put in a dry 1000 ml round-bottom flask with 200 ml of anhydrous diethyl ether. The solution is then cooled down to -80 °C, before dropwise addition of 2.5 M *n*-butyllithium solution (36.4 ml, 90.9 mmol, 1.1 eq.). The mixture is then left to react for 20 minutes before adding *n*-octyldimethylchlorosilane (18.81 g, 90.9 mmol, 1.1 eq.). The mixture can then be left to react overnight while heating up to RT. The product can be purified by a silica plug followed by distillation (110–115 °C, 0.35 mm Hg). The substance obtained is a transparent liquid (23.43 g, 85%). $^1\text{H NMR}$ 500 MHz (CDCl_3) δ (ppm): 7.46 (d, $J=4.8$ Hz, 1H) 7.11 (d, $J=4.8$ Hz, 1H), 1.34–1.24 (m, 12H), 0.92–0.87 (m, 5H), 0.39 (s, 6H). NMR data are identical as previously described.¹³

3-Fluoro-2-(dimethyloctylsilyl)thiophene (6)

3-Bromo-2-(dimethyloctylsilyl)thiophene (11.81 g, 35.42 mmol, 1 eq.) is put in a 250 ml dry round-bottom flask with 125 ml of anhydrous diethyl ether, which is then cooled to -78 °C. A 1.7 M *tert*-butyllithium solution in pentane (25 ml, 42.5 mmol, 1.2 eq.) is added dropwise, and then the mixture is stirred for 30 minutes at -80 °C. A precooled solution of *N*-fluorobenzenesulfonimide (13.4 g, 42.5 mmol, 1.2 eq.) in 275 ml of anhydrous tetrahydrofuran was added dropwise *via* a canula maintaining a temperature of -78 °C. The mixture is then left to react overnight while returning to RT. The solution is neutralized by addition of a saturated NH_4Cl solution and extracted three times with Et_2O . The organic layer was washed with water and brine, dried over anhydrous MgSO_4 , filtered and concentrated under vacuum. The crude product can be purified by a silica column followed by a C18 column, yielding the desired product as a transparent liquid (5.40 g, 56%). NMR data are identical as previously described in the literature.¹³ $^1\text{H NMR}$ 500 MHz (CDCl_3) δ (ppm): 7.39 (dd, $J=5.0, 2.8$ Hz, 1H), 6.85

(dd, $J = 5.0, 1.6$ Hz, 1H), 1.34–1.25 (m, 12H), 0.90–0.87 (m, 3H), 0.81–0.78 (m, 2H), 0.31 (s, 6H). ^{19}F NMR (500 MHz, CDCl_3) δ (ppm): –121 (s, 1F). NMR data are identical as previously described.¹³

4-Fluoro-5-(dimethyloctylsilyl)-2-thiophenecarbonitrile (7)

3-Fluoro-2-(dimethyloctylsilyl)thiophene (**6**) (4.74 g, 17.4 mmol, 1 eq.) is put in a round-bottom flask with 500 ml anhydrous diethyl ether, then cooled to -80°C . A *n*-butyllithium solution (2.5 M in hexanes, 7.7 ml, 19.1 mmol, 1.1 eq.) is added dropwise. The mixture is then stirred for 15 minutes at -80°C , then 30 minutes at 0°C . The flask is cooled back down to -80°C before adding neat phenyl cyanate (2.71 g, 22.6 mmol, 1.3 eq.) and stirring at this temperature for 30 minutes, then for 2 hours at 0°C . The mixture can then be left to react overnight while returning to RT. The reaction is quenched by adding a saturated NH_4Cl solution and then extracted three times with Et_2O . The organic layer was washed with water and brine, dried over anhydrous MgSO_4 , filtered and concentrated under vacuum. The product can be isolated by silica column, yielding a transparent liquid (4.14 g, 80%). ^1H NMR (500 MHz, CDCl_3) δ (ppm): 7.34 (d, $J = 1.6$ Hz, 1H), 1.34–1.25 (m, 12H), 0.90–0.87 (m, 3H), 0.84–0.80 (m, 2H), 0.34 (s, 6H). ^{19}F NMR (500 MHz, CDCl_3) δ (ppm): 118 (s, 1F). HRMS (ESI) m/z calcd for $\text{C}_{15}\text{H}_{24}\text{F}_1\text{N}_1\text{S}_1\text{Si}_1$ $[\text{M} + \text{H}]^+$ 298.1456, found 298.1445.

3,6-Bis(4-fluorothiophen-2-yl)-2,5-dihydropyrrolo[3,4-*c*]pyrrole-1,4-dione (fDT-DPP)

20 ml of 2-methyl-2-butanol is put in a dry twin-neck round-bottom flask equipped with a condenser, then heated up to 105°C . Sodium (0.432 g, 18.8 mmol, 4 eq.) is added piecemeal to the liquid, which is then stirred until complete digestion. 4-Fluoro-5-(dimethyloctylsilyl)-2-thiophenecarbonitrile (2.934 g, 9.86 mmol, 2.1 eq.) is added rapidly, then diisopropyl succinate (0.950 g, 4.70 mmol, 1 eq.) is added dropwise. The mixture is then left to react overnight at 110°C . The solution is then cooled down to 60°C before adding methanol and stirring for 1 hour. The mixture is then neutralized by adding acetic acid (1.34 ml, 23.5 mmol, 5 eq.). The mixture can be filtered by Büchner and washed with methanol. The product is obtained as a purple solid (1.31 g, 83%). ^{19}F NMR (470 MHz, DMSO, 60°C) δ (ppm) –126.98 (s, 2F). ^1H NMR (500 MHz, DMSO, 60°C) δ (ppm): 11.19 (s, 2H), 8.02 (d, $J = 1.7$ Hz, 2H), 7.60 (app. t, $J = 1.4$ Hz, 2H).

3,6-Bis(4-fluorothiophen-2-yl)-2,5-bis(4-tetradecyloctadecyl)-2,5-dihydropyrrolo[3,4-*c*]pyrrole-1,4-dione (8a)

In a two-neck flask equipped with a condenser, 3,6-bis(4-fluorothiophen-2-yl)-2,5-dihydropyrrolo[3,4-*c*]pyrrole-1,4-dione (fDT-DPP) (443 mg, 1.32 mmol, 1 eq.) was stirred at r.t. in dry DMF (9 ml, 0.15 M). 15-(3-Bromopropyl)triacontane (2.09 g, 3 eq.) was added to the mixture followed by dry K_2CO_3 (546 mg, 3 eq.) then the mixture was stirred at 100°C for 24 h. After cooling at r.t., the reaction was quenched by the addition of 1 M HCl solution and extracted three times with Et_2O . The organic layer was washed with water and brine, dried over anhydrous MgSO_4 , filtered and concentrated under vacuum. The solid residue was purified by chromatography

on silica gel with Hexane/ CHCl_3 , 70 to 100%, to afford the desired product as a deep purple solid (730 mg, 45%). ^{19}F NMR (470 MHz, CDCl_3) δ –125.87 (s, 2F). ^1H NMR (500 MHz, CDCl_3) 8.71 (d, $J = 1.7$ Hz, 2H), 7.10–6.87 (m, 2H), 4.05–3.96 (m, 5H), 1.76–1.65 (m, 4H), 1.39–1.15 (m, 127H), 0.93–0.83 (m, 12H). ^{13}C NMR (126 MHz, CDCl_3) δ 160.76, 158.61 (d, $J = 260.4$ Hz), 139.24 (d, $J = 2.8$ Hz), 128.22 (d, $J = 9.4$ Hz), 123.94 (d, $J = 27.5$ Hz), 109.04 (d, $J = 21.5$ Hz), 108.14, 42.66, 37.25, 33.63, 32.08, 30.58, 30.23, 29.87, 29.83, 29.53, 27.14, 26.82, 22.83, 14.24. HRMS (APPI) m/z calcd for $\text{C}_{78}\text{H}_{134}\text{F}_2\text{N}_2\text{O}_2\text{S}_2$ $[\text{M} + \text{H}]^+$ 1233.9928, found 1233.9942.

3,6-Bis(4-fluorothiophen-2-yl)-2,5-bis(4-octadecyldocosyl)-2,5-dihydropyrrolo[3,4-*c*]pyrrole-1,4-dione (8b)

In a two-neck flask equipped with a condenser, 3,6-bis(4-fluorothiophen-2-yl)-2,5-dihydropyrrolo[3,4-*c*]pyrrole-1,4-dione (fDT-DPP) (797 mg, 2.37 mmol, 1 eq.) was stirred at r.t. in dry DMF (16 ml, 0.15 M). 19-(3-Bromopropyl)heptatriacontane (3.35 g, 2.2 eq.) was added in the mixture followed by dry K_2CO_3 (720 mg, 2.2 eq.) and then the mixture was stirred at 100°C for 24 h. After cooling at r.t., the reaction was quenched by addition of 1 M HCl solution and extracted three times with Et_2O . The organic layer was washed with water and brine, dried over anhydrous MgSO_4 , filtered and concentrated under vacuum. The solid residue was purified by chromatography on silica gel with Hexane/ CHCl_3 , 70 to 100%, to afford the desired product as a deep purple solid (1.82 g, 53%).

^{19}F NMR (470 MHz, CDCl_3) δ –125.87 (s, 2F). ^1H NMR (500 MHz, CDCl_3) 8.71 (d, $J = 1.7$ Hz, 2H), 7.03 (d, $J = 1.7$ Hz, 2H), 4.08–3.91 (m, 4H), 1.77–1.61 (m, 4H), 1.24 (d, $J = 5.3$ Hz, 148H), 0.88 (t, $J = 6.9$ Hz, 12H). ^{13}C NMR (126 MHz, CDCl_3) δ 161.00, 158.7 (d, $J = 260.8$ Hz), 139.45 (d, $J = 2.9$ Hz), 128.26 (d, $J = 9.1$ Hz), 123.95 (d, $J = 27.7$ Hz), 109.16 (d, $J = 21.5$ Hz), 108.30, 77.41, 77.16, 76.91, 42.72, 37.27, 33.65, 32.09, 30.61, 30.24, 29.88, 29.83, 29.53, 27.21, 26.83, 22.85, 14.27. HRMS (APPI) m/z calcd for $\text{C}_{94}\text{H}_{166}\text{F}_2\text{N}_2\text{O}_2\text{S}_2$ $[\text{M} + \text{H}]^+$ 1458.2386, found 1458.2410.

3,6-Bis(5-bromo-4-fluorothiophen-2-yl)-2,5-bis(4-tetradecyloctadecyl)-2,5-dihydropyrrolo[3,4-*c*]pyrrole-1,4-dione (9a)

To a solution of (**8b**) (870 mg, 0.705 mmol, 1 eq.) in degassed CHCl_3 (14 ml, 0.05 M) under nitrogen was added portionwise freshly crystallized NBS (376 mg, 3 eq.) and the solution was stirred at 50°C in the dark for 1.5 h. Water was added and the mixture was extracted with chloroform. The organic layer was washed with water and brine, dried over MgSO_4 , filtered and concentrated under vacuum. The residue was purified by chromatography in silica gel with hexane/ CHCl_3 , 50 to 80%, followed by recrystallization from hexane to give the desired product as a purple solid (491 g, 50%). ^{19}F NMR (470 MHz, CDCl_3) δ –124.24 (s, 2F). ^1H NMR (500 MHz, CDCl_3) 8.64 (s, 2H), 3.98–3.91 (m, 4H), 1.73–1.62 (m, 4H), 1.24 (q, $J = 8.3, 5.7$ Hz, 123H), 0.91–0.79 (m, 12H). ^{13}C NMR (126 MHz, CDCl_3) δ 160.45, 156.53 (d, $J = 262.1$ Hz), 138.47 (d, $J = 3.3$ Hz), 127.45 (d, $J = 9.1$ Hz), 123.18 (d, $J = 26.5$ Hz), 108.12, 98.88 (d, $J = 22.9$ Hz), 42.54, 36.95, 33.37, 31.84, 30.26, 29.99, 29.58, 29.28,

26.91, 26.59, 22.60, 14.02. HRMS (APPI) m/z calcd for $C_{78}H_{132}Br_2F_2N_2O_2S_2 [M + H]^+$ 1391.8130, found 1391.8140.

3,6-Bis(5-bromo-4-fluorothiophen-2-yl)-2,5-bis(4-octadecyldocosyl)-2,5-dihydropyrrolo[3,4-*c*]pyrrole-1,4-dione (9b)

To a solution of (8a) (1.89 g, 1.3 mmol, 1 eq.) in degassed $CHCl_3$ (36 ml, 0.05 M) under nitrogen was added portionwise freshly crystallized NBS (484 mg, 2.1 eq.) and the solution was stirred at 50 °C in the dark for 1.5 h. Water was added and the mixture was extracted with chloroform. The organic layer was washed with water and brine, dried over $MgSO_4$, filtered and concentrated under vacuum. The residue was purified by chromatography in silica gel with hexane/ $CHCl_3$, 50 to 80%, followed by recrystallization from hexane to give the desired product as a purple solid (1.52 g, 73%). ^{19}F NMR (470 MHz, $CDCl_3$) δ -124.22 (s, 2F). 1H NMR (500 MHz, $CDCl_3$) δ 8.64 (s, 2H), 4.00–3.81 (m, 4H), 1.71–1.62 (m, 4H), 1.39–1.15 (m, 148H), 0.88 (t, $J = 6.9$ Hz, 12H). ^{13}C NMR (126 MHz, $CDCl_3$) δ 160.77, 156.88 (d, $J = 257.0$ Hz), 138.77 (d, $J = 3.1$ Hz), 127.88 (d, $J = 9.3$ Hz), 123.38 (d, $J = 26.5$ Hz), 108.60, 99.00 (d, $J = 22.9$ Hz), 77.41, 77.16, 76.91, 42.87, 37.36, 33.80, 32.10, 30.74, 30.27, 29.88, 29.83, 29.52, 27.29, 26.94, 22.84, 14.21. HRMS (APPI) m/z calcd for $C_{94}H_{164}Br_2F_2N_2O_2S_2 [M + H]^+$ 1616.0582, found 1616.0680.

4,4'-Difluoro-2,2'-bithiophene (10)

To a solution of (4-fluorothiophen-2-yl)dimethyl(octyl)silane (6) (2.476 g, 9.09 mmol, 1 eq.) in dry THF under argon at -78 °C was added dropwise $nBuLi$ (2.5 M in hexane, 4 ml, 1.1 eq.). The mixture was stirred for 30 min at r.t. then cooled at -78 °C. Dry $CuCl_2$ (1.47 g, 1.2 eq.) was added in one shot and the solution was warmed to r.t. and stirred overnight. A 1 M HCl solution was added to quench the reaction and the resulting mixture was extracted with Et_2O . The organic layer was washed with water and brine then dried over anhydrous $MgSO_4$. The mixture was filtrated, and the solvent was evaporated by vacuum. The residue was filtered on a short pad of silica with hexane and concentrated under vacuum. The residue was dissolved in DCM (0.8 M) and TBAF- $3H_2O$ (2.1 g, 2 eq.) was added and the mixture was stirred at r.t. for 2 h. Water was added, and the solution was extracted with DCM. The organic layer was washed with water and brine and dried over anhydrous $MgSO_4$, filtered and concentrated under vacuum. The residue was purified by chromatography on silica gel with hexane, followed by recrystallization from MeOH to give (10) as a white solid (589 g, 64%). m. p. = 61 °C, ^{19}F NMR (470 MHz, $CDCl_3$) δ -126.16 (s, 2F). 1H NMR (500 MHz, $CDCl_3$) 6.93 (d, $J = 1.7$ Hz, 2H), 6.63 (t, $J = 1.5$ Hz, 2H). ^{13}C NMR (126 MHz, $CDCl_3$) δ 157.65 (d, $J = 259.3$ Hz), 135.74 (dd, $J = 9.1, 2.0$ Hz), 113.92 (d, $J = 27.5$ Hz), 103.03 (d, $J = 21.3$ Hz). HRMS (APPI) m/z calcd for $C_8H_4F_2S_2 [M]^+$ 201.9717, found 201.9737.

5-(Dimethyl(octyl)silyl)-4-fluorothiophene-2-carbaldehyde (11)

3-Fluoro-2-(dimethyloctylsilyl)thiophene (6) (2 g, 7.35 mmol, 1 eq.) was put in a dry 250 ml round-bottom flask with a magnetic stirrer under an argon atmosphere, then 40 ml of dry THF was added. The mixture was cooled to -80 °C, then

2.5 M *n*-butyllithium (3.1 ml, 7.72 mmol, 1.05 eq.) was added dropwise. The mixture was stirred for 30 minutes at -80 °C, and then dimethyl formamide (0.740 ml, 9.56 mmol, 1.3 eq.) was added dropwise, then the mixture was stirred overnight and allowed to reach room temperature. The reaction mixture was then neutralized with a saturated NH_4Cl solution, then extracted with hexanes, washed with water and brine, and dried over $MgSO_4$. The solvent was then removed under vacuum. The product was purified by column chromatography on silica gel, the eluent being a hexanes/diethyl ether mix (90/10), affording the compound as a colorless oil ($Y = 80\%$). The spectral data was identical with the reported values.¹³ ^{19}F NMR (470 MHz, $CDCl_3$) δ -116.6 (s, 1F). 1H NMR (500 MHz, $CDCl_3$) 9.80 (s, 1H), 7.47 (d, $J = 1.7$ Hz, 1H), 1.39–1.09 (m, 12H), 0.94–0.68 (m, 5H), 0.35 (s, 6H).

(*E*)-1,2-Bis(4-fluorothiophen-2-yl)ethene (12)

Activated Zn^0 (0.78 g, 12 mmol, 2.4 eq.) was put in a dry three-necked 250 ml flask along with 30 ml of dry THF and put under an argon atmosphere. The reaction medium was cooled to 0 °C, followed by a slow addition of neat $TiCl_4$ (1.14, 6 mmol, 1.2 eq.) and then stirred for 1 h at 65 °C. The mixture was then cooled to room temperature, and a solution of 4-fluoro-5-(dimethyloctylsilyl)-2-thiophenecarboxaldehyde (1.5 g, 5.00 mmol, 1 eq.) dissolved in dry THF was inserted in the reaction medium through a canula. The resulting mixture was then stirred overnight at a temperature of 70 °C. The product was then extracted with hexanes, washed with water and brine, and dried over $MgSO_4$. The solvent was evaporated under vacuum. The crude product was dissolved in 50 ml of dichloromethane, TBAF- $3H_2O$ (3.16 g, 2 eq.) was added and the mixture was stirred at room temperature for 2 h. The mixture was extracted with hexanes and washed with water and brine. The solvent was then removed under vacuum. The product was purified with column chromatography on silica gel with a hexanes/ethyl acetate mix (98/2) as the eluent, yielding a white powder ($Y = 46\%$). m. p. = 124 °C, ^{19}F NMR (470 MHz, $CDCl_3$) δ -126.7 (s, 2F). 1H NMR (500 MHz, $CDCl_3$) δ 6.90 (s, 2H), 6.82 (dd, $J = 1.6, 0.7$ Hz, 2H), 6.61–6.56 (m, 2H). ^{13}C NMR (126 MHz, $CDCl_3$) δ 157.87 (d, $J = 258.7$ Hz), 140.16 (d, $J = 8.4$ Hz), 121.42 (d, $J = 2.4$ Hz), 115.75 (d, $J = 26.8$ Hz), 102.65 (d, $J = 21.4$ Hz). HRMS (APPI) m/z calcd for $C_{10}H_6F_2S_2 [M^*]$ 227.9879, found 227.9864.

3,3',4,4'-Tetrafluoro-2,2'-bithiophene (14)

The product was obtained from 3,4-dibromothiophene following the described literature procedure⁸ as a white solid (230 mg, 22% overall yield in 5 steps). m. p. = 96 °C, ^{19}F NMR (470 MHz, $CDCl_3$) δ -134.98 (d, $J = 12.5$ Hz, 2F), -136.39 (d, $J = 12.4$ Hz, 2F). 1H NMR (500 MHz, $CDCl_3$) δ 6.78–6.75 (m, 2H). ^{13}C NMR (126 MHz, $CDCl_3$) δ 145.44 (dd, $J = 261.8, 19.2$ Hz), 142.16 (dd, $J = 266.6, 20.9$ Hz), 110.93 (ddd, $J = 6.9, 5.0, 3.3$ Hz), 102.66 (dt-like, $J = 15.8, 4.2$ Hz). HRMS (APPI) m/z calcd for $C_8H_2F_4S_2 [M]^+$ 237.9529, found 237.9562.

Conflicts of interest

There are no conflicts to declare.
