**Fig. 3** hDMECs organization on COL-GAG and GG-HyA scaffolds after 3 and 7 days. (A) Chosen plasmids were delivered to hDFBs and seeded in different scaffolds. The angiogenic capacity of the system is maximized through the release of angiogenic proteins providing a 3D microenvironment for endothelial cells proliferation and organization. (B) hDFBs were transfected with PEI-pVEGF, Ch-pFGF2 and the dual combination of both (P + C) and seeded on COL-HyA, COL-ChS and GG-HyA scaffolds with hDMECs. Control corresponds to co-cultures where hDFBs were not transfected. In all scaffolds, co-culture of hDMECs (CD31) with PEI-pVEGF hDFBs showed the formation of an extensive CD31 + endothelial network (white arrows) in all conditions after 7 days. Scale bar: 75  $\mu$ m.

The Royal Society of Chemistry apologises for these errors and any consequent inconvenience to authors and readers.
