## ***t*-BuOK mediated oxidative coupling amination of 1,4-naphthoquinone and related 3-indolyl naphthoquinones with amines†**

 Yu Dong, <sup>a</sup> Ting Mei, <sup>a</sup> Qi-Qi Luo, <sup>a</sup> Qiang Feng, <sup>a</sup> Bo Chang, <sup>a</sup> Fan Yang, <sup>a</sup> Hong-wei Zhou, <sup>a</sup> Zhi-Chuan Shi, <sup>b</sup> Ji-Yu Wang, <sup>\*c</sup> and Bing He <sup>\*a</sup>

The transition-metal free amination of 1,4-naphthoquinone and related 3-indolyl naphthoquinones with amines, such as various (hetero)aromatic amine and aliphatic amine via *t*-BuOK-mediated oxidative coupling at room temperature has been developed. This reaction provides efficient access to the biologically important and synthetically useful 2-amino-1,4-naphthoquinones and 2-amino-3-indolyl naphthoquinones with good yields under mild conditions. The present protocol is simple, practical and shows good functional group tolerance. In addition, the obtained 2-amino-3-indolyl naphthoquinones were further transformed to synthesize polycyclic N-heterocycles.

### Introduction

The quinone scaffold can be found not only in various natural products and pharmaceutical compounds<sup>1</sup> but it is also well-known as a versatile building block extensively applied in organic synthesis and functional materials.<sup>2</sup> Among the derivatives of quinone, the 2-amino-1,4-naphthoquinone (**I**) moiety is found in a considerable number of natural product antibiotics (Fig. 1).<sup>3</sup> The representative compounds include the quinone-fused polycyclic N-heterocycles calothrixin A (antiproliferative and potent antimalarial)<sup>4</sup> and hygrocins A, isolated during the purification of the immunosuppressive agent rapamycin from *Streptomyces hygroscopicus* ATC25293.<sup>5</sup> Additionally, 2-amino-1,4-naphthoquinone is also important as an intermediate for the synthesis of biologically active compounds.<sup>6</sup>

2-Amino-1,4-naphthoquinone has demonstrated that the amino group in the naphthoquinone structure can change the electron-accepting capacity and therefore result in increased biological activities.<sup>7</sup> What's more, this type of compound possesses several interesting biological properties such as antibacterial,<sup>8</sup> antifungal,<sup>9</sup> and anticancer activities.<sup>10</sup> Therefore, much effort has been devoted to developing synthetic methods for the construction of 2-amino-1,4-naphthoquinone derivatives. The reaction of amines with 1,4-naphthoquinone derivatives to give 2-amino-1,4-naphthoquinone have been

developed with two general methods. On the one hand, 2-amino-1,4-naphthoquinones are prepared by oxidative addition coupling of amines to naphthoquinones in the presence of catalysts such as  $\text{CeCl}_3 \cdot 7\text{H}_2\text{O}$ ,<sup>11</sup>  $\text{FeCl}_3$ ,<sup>12</sup>  $\text{Cu}(\text{OAc})_2$ ,<sup>13</sup>  $\text{I}_2$ ,<sup>14</sup>  $\text{Au}^{15}$  and  $\text{HClO}_4\text{-SiO}_2$ .<sup>16</sup> Wang reported that 2-amino-1,4-naphthoquinones were obtained by combine the nitro reduction with the 1,4-nucleophilic addition of amines to 1,4-naphthoquinones.<sup>17</sup> On the other hand, nucleophilic substitution reactions of 2-halonaphthoquinones,<sup>18</sup> or 2-methoxynaphthoquinone derivatives<sup>19</sup> also can afford 2-amino-1,4-naphthoquinones. The studies reported that the use of water was beneficial, resulting in nucleophilic substitution and addition reactions with quinones.<sup>20</sup> The use of a bentonitic clay and ultrasonic irradiation were reported to give moderate to excellent yields of 2-amino-1,4-naphthoquinones.<sup>21</sup>

With the objective of studying concise routes into natural products, their analogues, and polyheteroaromatic systems

<sup>b</sup> Isolated yield. <sup>c</sup> **2a** (0.6 mmol, 2 equiv.), DMF = *N,N*-dimethylformamide; DMAP = 4-dimethylaminopyridine; DMSO = dimethyl sulfoxide; HFIP = 1,1,1,3,3,3-hexafluoroisopropanol; NR = no reaction.

with the 2-amino-1,4-naphthoquinone moiety, we initially investigated a synthetic protocol. To the best of our knowledge, an efficient synthesis of 2-amino-1,4-naphthoquinones *via* a *t*-BuOK mediated direct amination has not yet been reported. As always, we have been interested in the synthesis of indolynaphthoquinones and related derivatives. In consideration of the important pharmaceutical applications of the unique 2-amino-1,4-naphthoquinones structural motif, we report herein a simple and practical method for the synthesis of 2-amino-1,4-naphthoquinones and 2-amino-3-indolynaphthoquinones by the *t*-BuOK mediated oxidative coupling amination of 1,4-naphthoquinone and related 3-indolynaphthoquinones with amines.

## Results and discussion

Our investigation to explore amination began with the reaction of indolynaphthoquinone (**1a**) and aniline (**2a**) (see Table 1, as well as Tables S1–S4 in the ESI<sup>†</sup>). The reaction of *t*-BuOK (1.5 equiv.), and DMF (2 mL), at room temperature under air atmosphere, for 6 h (Table 1, entry 1), afforded the desired product **3a** in 53% isolated yield. Encouraged by this result, subsequently, variation of K<sub>2</sub>CO<sub>3</sub> to NaHCO<sub>3</sub>, KOH, NaOH, CH<sub>3</sub>ONa, CS<sub>2</sub>CO<sub>3</sub>, Et<sub>3</sub>N, or DMAP did not show any improvement (entries 2–7; see ESI<sup>†</sup>). The use of DMF as a solvent was crucial, as the reaction gave poor results in other solvents such

Table 2 Scopes with respect to 3-arylnaphthoquinones with amines<sup>a</sup>

<sup>a</sup> Reaction conditions: **1** (0.3 mmol), **2** (0.6 mmol), *t*-BuOK (2.0 equiv.), DMF (2.0 mL), 2 h, air, rt. Isolated yield. <sup>b</sup> In a 5 mmol scale.

as DMAC, HFIP, dioxane, PhCF<sub>3</sub> or DMSO, (entries 8–11; see ESI<sup>†</sup>). The reaction performed under an air atmosphere in the absence of base afforded no product (entry 12), which showed that the base played a pivotal role in obtaining the desired product. Afterward, the amount of *t*-BuOK or **2a** were further screened (entries 13–14; see ESI<sup>†</sup>). It was found that the yields of the product increased with the improved in the amount of *t*-BuOK or **2a**. Therefore, the optimal conditions for the preparation of 2-amino-1,4-naphthoquinones and 2-amino-3-indolynaphthoquinones were obtained: **2a** (2 equiv.), *t*-BuOK (2 equiv.), in DMF (2 mL) at room temperature for 2 h (Table 1, entry 15).

With the optimized reaction conditions in hand, subsequently, a series of substituted indolynaphthoquinones and amines were tested for the amination (Table 2). To find the

Table 3 Scopes with respect to 1,4-naphthoquinone with amines<sup>a</sup>

<sup>a</sup> Reaction conditions: 1,4-naphthoquinone (0.3 mmol), 2 (0.6 mmol), *t*-BuOK (2.0 equiv.), DMF (2.0 mL), 2 h, air, rt. Isolated yield. <sup>b</sup> In a 5 mmol scale.

substrate scope leading to 3, a variety of substituted anilines were sequentially coupled with 3-indolynaphthoquinone (**1a**) afforded the corresponding products **3** in good yields in spite of the electronic nature of aniline (**3a-h**, Table 2). In a 5 mmol scale reaction, **3a** could be obtained in 83% yield, which indicates this transformation could be conducted in a larger scale. It is noteworthy that the valuable groups (F, Cl, Br) could be readily tolerated, which provides an opportunity for further elaboration. Even heteroanilines are well tolerated in this reaction. The use of aminopyridine provides moderate yields of the desired products (**3i**). The strongly coordinating groups (pyridine), which were employed as reagents for direct C-H functionalization, were fully tolerated with high chemoselectivity and regioselectivity. Next, a variety of indolynaphthoquinones were also examined as substrates for the reaction strategy. The reaction conditions are mild and notably compatible with chloro, fluoro, and methyl on the aryl ring (**3j-l**, Table 2). In addition, phenylnaphthoquinone was treated with

Scheme 1 *R*<sub>1</sub> and *R*<sub>2</sub> = H unless otherwise stated. **6a** *R*<sub>1</sub> and *R*<sub>2</sub> = H, 81%; **6b** *R*<sub>1</sub> = Cl, 62%; **6c** *R*<sub>2</sub> = F, 56%.

Scheme 2 Plausible reaction mechanism.

**2a** under the optimized reaction conditions for the synthesis of **3m** with moderate yields.

The reaction scope was next examined by using different substituted anilines with 1,4-naphthoquinone **4a** as a model substrate (Table 3). Various anilines with different electronic and steric nature were tolerated under the reaction conditions to afford 2-amino-1,4-naphthoquinones **5a-5h** in moderate to high yields. In a 5 mmol scale reaction, **5a** could be obtained in 89% yield, which indicates this transformation could be conducted in a larger scale. Naphthylamine and disubstituted aniline were also suitable reaction partners to give corresponding products **5i** and **5j**. Especially, heteroanilines and aliphatic amine were amenable under our reaction conditions and provided the expected coupling product **5k** and **5l**.

Polycyclic N-heterocycles are the key structural element of natural products, drugs and functional materials.<sup>22</sup> Therefore, a Co-catalyzed intramolecular cyclization reaction of some of the 2-amino-3-indolynaphthoquinones derivatives **3** allowed the generation of polycyclic N-heterocycles derivatives **6** in moderate yields (Scheme 1).

On the basis of our and previous reports,<sup>23</sup> a possible reaction mechanism was proposed (Scheme 2). Initially, the Michael addition of indolynaphthoquinone (**1a**) and aniline (**2a**) in the presence of base gave the intermediate **A**, which was immediately oxidized to the product **3a** by O<sub>2</sub> or the oxidative naphthoquinone.

## Conclusions

In conclusion, we have developed a practical and efficient strategy for *t*-BuOK-mediated oxidative coupling amination of 1,4-naphthoquinone and related 3-indolynaphthoquinones with amines at room temperature. A series of 2-amino-1,4-naphthoquinones and 2-amino-3-indolynaphthoquinones were conveniently synthesized in good yields under air

conditions. The reaction took place under mild conditions, displayed excellent functional group compatibility, and did not use metals. In addition, the obtained 2-amino-3-indolyl naphthoquinones derivatives were conducted further transformation to synthesize polycyclic N-heterocycles.
