# A general method for the synthesis of covalent and ionic amine borane complexes containing trinitromethyl fragments†

 Jin Wang,<sup>ac</sup> Ming-Yue Ju,<sup>a</sup> Xi-Meng Chen<sup>\*a</sup> and Xuenian Chen<sup>id</sup> <sup>\*ab</sup>

A general approach for the synthesis of covalent and ionic amine borane complexes containing trinitromethyl fragments has been developed through metathesis reactions between amine chloroborane complexes and potassium salt of trinitromethyl (K[C(NO<sub>2</sub>)<sub>3</sub>]). Five covalent and ionic trinitromethyl amine borane complexes have been synthesized in good yields with high purity and it is found that the ionic complex, [H<sub>2</sub>B(NH<sub>3</sub>)<sub>2</sub>][C(NO<sub>2</sub>)<sub>3</sub>], might be a promising energetic material on the basis of the investigation of its thermal decomposition behaviour.

## Introduction

Nitroform (CH(NO<sub>2</sub>)<sub>3</sub>) holds a unique position among nitro compounds as it is a valuable starting material for the preparation of propellant and explosive components due to its high oxygen content.<sup>1</sup> Ioffe group reported the syntheses and transformations of trinitromethylborane complexes with cyclic ethers and aromatic N-containing heterocycles, and also discussed the principle of the reactions.<sup>2</sup> However, they attempted to obtain *N,N*-dinitroamidoborane complexes using the same method, but failed.<sup>2a</sup> Klapötke and coworkers studied the reactions of boron oxide (B<sub>2</sub>O<sub>3</sub>) with various nitro-substituted ethanols (2-nitroethanol, 2-fluoro-2,2-dinitroethanol, and 2,2,2-trinitroethanol) to furnish the corresponding nitroethyl borates B(OCH<sub>2</sub>CH<sub>2</sub>NO<sub>2</sub>)<sub>3</sub>, B(OCH<sub>2</sub>CF(NO<sub>2</sub>)<sub>2</sub>)<sub>3</sub>, and B(OCH<sub>2</sub>-C(NO<sub>2</sub>)<sub>3</sub>)<sub>3</sub>.<sup>3</sup> The compound B(OCH<sub>2</sub>C(NO<sub>2</sub>)<sub>3</sub>)<sub>3</sub> can be used as green-light-emitting pyrotechnic composition.<sup>4</sup>

Interestingly, C(NO<sub>2</sub>)<sub>3</sub>, as an oxidizing group, can be introduced into the design of high-energy molecules to co-exist with powerful reducing borohydride in a single covalently bonded structure.<sup>5</sup> In 2013, Christie group used CH(NO<sub>2</sub>)<sub>3</sub> and NaBH<sub>4</sub> as starting materials to synthesize [Na(glyme)<sub>2</sub>][BH<sub>3</sub>C(NO<sub>2</sub>)<sub>3</sub>].<sup>5</sup> Subsequently, they employed metathesis reactions to convert this salt into PNP<sup>+</sup> and PPh<sup>4+</sup> analogs that were stable for several months at room temperature. In 2015, ammonia-dinitroamidoborane, NH<sub>3</sub>BH<sub>2</sub>N(NO<sub>2</sub>)<sub>2</sub> was synthesized by the

reaction of dinitroamine (HN(NO<sub>2</sub>)<sub>2</sub>) with ammonia borane (NH<sub>3</sub>BH<sub>3</sub>). This compound is expected to have a good performance as an explosive being comparable to that of pentaerythritol tetranitrate and significantly greater than that of trinitrotoluene.<sup>6</sup> So, highly energetic oxidized analogs have attracted attention recently.

NH<sub>3</sub>BH<sub>3</sub>, a potential hydrogen storage material, has received immense interest in the past twenty years owing to its high percentage of hydrogen (19.6 wt%), excellent stability at room temperature, and release of hydrogen under mild conditions.<sup>7</sup> It can also provide both a proton and hydride in chemical reactions under mild conditions.<sup>8</sup> In NH<sub>3</sub>BH<sub>3</sub>, the nitrogen atom can be bonded to proton, hydrocarbon, hydroxyl, oxygen and other groups,<sup>9</sup> and the boron atom can be bonded to hydride, hydrocarbon, oxygen, oxynitride, halogen and other electron donors that can interact with the empty orbital on boron.<sup>10</sup> Many derivatives could be obtained from NH<sub>3</sub>BH<sub>3</sub>, including ammonia monochloroborane (NH<sub>3</sub>BH<sub>2</sub>Cl)<sup>11–14</sup> which is an important intermediate for the synthesis of a series of more complex boron compounds<sup>15</sup> such as R<sub>1</sub>R<sub>2</sub>N=BH<sub>2</sub> (ref. 12a) and amorphous boron nitride.<sup>11b</sup>

In this work, ammonia and amine monochloroborane complexes (ABH<sub>2</sub>Cl, A = NH<sub>3</sub>, aliphatic primary, secondary, tertiary amine, and diamines, **1**) were treated with K[C(NO<sub>2</sub>)<sub>3</sub>], a milder oxidizing reagent in comparison with CH(NO<sub>2</sub>)<sub>3</sub>,<sup>16</sup> to prepare target product **3**, with the general formula of ABH<sub>2</sub>-C(NO<sub>2</sub>)<sub>3</sub>, containing both reducing and oxidizing fragments in a single covalently bonded structure. Furthermore, an ionic complex, [H<sub>2</sub>B(NH<sub>3</sub>)<sub>2</sub>][C(NO<sub>2</sub>)<sub>3</sub>], was synthesized from **3a**.

## Results and discussion

The reactions of each amine borane complex ABH<sub>3</sub> (**2a–d**) with HCl diethyl ether solution at room temperature resulted in the formation of amine monochloroborane complexes (**1a–d**) in

<sup>a</sup> A is the Lewis base, X is the substituent group. <sup>b</sup> Molecular formula  $(\text{NH}_2\text{CH}_2\text{BH}_2\text{Cl})_2$ . <sup>c</sup> Molecular formula  $[\text{NH}_2\text{CH}_2\text{BH}_2\text{C}(\text{NO}_2)_3]_2$ .

Thermal decomposition of **3a** and **3g** was studied by DSC and TGA-MS. As shown in Fig. 1 and 2, thermal decomposition resulted in the generation of  $\text{H}_2$ ,  $\text{N}_2$ ,  $\text{NH}_3$ ,  $\text{CO}_2$ ,  $\text{N}_2\text{O}$  and  $\text{NO}_2$ , hence the decomposition is believed to proceed according to eqn (1) and (2), respectively.

Gaseous products were analysed by mass spectrometry (MS), and solid residues were determined by IR and XRD. It was observed that **3a** starts decomposing at 98 °C and the first-stage weight loss is only 1.7 wt%, corresponding to the evolution of hydrogen and nitrogen dioxide, and the  $m/z$  44 signal is assigned to  $\text{N}_2\text{O}$  or  $\text{CO}_2$  evolution. The decomposition behaviour of **3a** is similar to that of the energetic oxidizer hydrazinium nitroformate ( $\text{N}_2\text{H}_5\text{C}(\text{NO}_2)_3$ , HNF), as shown in eqn (3).<sup>18</sup> The second-stage weight loss is as large as 31.2 wt%, associated with  $\text{H}_2$ ,  $\text{N}_2$ ,  $\text{NH}_3$ ,  $\text{CO}_2$ ,  $\text{N}_2\text{O}$  and  $\text{NO}_2$  evolution. Both the first and second steps for **3a** are exothermic events, the  $m/z$  2, 28, 17, 44, and 46 signals recorded by the MS during the TGA-MS experiment to 400 °C are overlaid in Fig. 1b. At higher temperatures, it further decomposes and boron oxide was formed (Fig. S1 and S2†).

The thermal decomposition pattern of **3g** is different from **3a**. The large weight loss of 30.6 wt%, observed at 95 °C with

Fig. 1 (a) TGA and DSC curves and (b) TGA-MS analysis of **3a** in the temperature range 30–400 °C with a heating rate of 3 °C min<sup>-1</sup>.

Fig. 2 (a) TGA and DSC curves (b) TGA-MS analysis of **3g** in the temperature range 30–400 °C with a heating rate of 3 °C min<sup>-1</sup>.

strongly exothermic, is associated with  $\text{H}_2$ ,  $\text{N}_2$ ,  $\text{NH}_3$ ,  $\text{CO}_2$ ,  $\text{N}_2\text{O}$  and  $\text{NO}_2$  evolution. At higher temperature, it further decomposes to release  $\text{N}_2\text{O}$ ,  $\text{CO}_2$  and  $\text{NO}_2$ , resulting in boron oxide (Fig. S3 and S4†). The thermal decomposition behaviours of **3a** and **3g** are different from those of  $\text{NH}_3\text{BH}_2\text{Cl}$ , their parent compound. It was recorded that only  $\text{H}_2$  was released at the initial stage (eqn (4)), and then the second large weight loss was associated with both  $\text{H}_2$  and  $\text{HCl}$  (eqn (5)). At higher temperature, it further decomposes to evolve  $\text{HCl}$  and  $\text{H}_2$  to form boron nitride (eqn (6)).<sup>11c</sup>

## Conclusions

In summary, we have developed general methods for the syntheses of both covalent and ionic complexes containing the amine borane reducing group and the trinitromethyl oxidizing group in one molecule under mild conditions. These complexes were successfully isolated in high yields and characterized by NMR and IR. Thermal decomposition was investigated by TGA-MS and DSC, and results implicated that compound **3g** may be a promising explosive material. Further studies on the explosive property of **3g** are in progress in our lab.

## Experimental

**CAUTION!** All nitrogen- and oxygen-rich compounds are potentially explosive energetic materials which should be handled with great care, although no hazards were observed during preparation and handling of these compounds. In any case, it is necessary to take proper precautions by employing all standard energetic materials safety procedures in experiments involving such substances, such as face shields, a leather apron, gloves, and hearing protection should be employed.

### General information

All manipulations were carried out under a nitrogen atmosphere using standard Schlenk techniques and glove box. The

$^{11}\text{B}$  NMR and  $^{11}\text{B}\{^1\text{H}\}$  NMR spectra were recorded at 128 or 193 MHz spectrometers and externally referenced to  $\text{BF}_3 \cdot \text{OEt}_2$  in  $\text{C}_6\text{D}_6$  ( $\delta = 0.00$  ppm). The  $^1\text{H}$  NMR and  $^1\text{H}\{^{11}\text{B}\}$  NMR spectra were obtained at 600 MHz spectrometer. The  $^{13}\text{C}$  NMR spectra were recorded at 151 MHz. IR spectra were measured by a Spectrum 400F. X-ray diffraction (XRD) data were obtained with a Rigaku D/max 2500 diffractometer using  $\text{Cu}/\text{K}\alpha$  radiation,  $\lambda = 0.1542$  nm, 40 kV, 100 mA. The thermal behaviours of compounds **3a** and **3g** were determined by synchronous thermal analyses (TGA-DSC, Netzsch 449C Jupiter/QMS 403D). The samples were heated to 500 °C with a heating rate of 3 °C  $\text{min}^{-1}$ , under a flowing Ar atmosphere.

Anhydrous nitric acid, sulphuric acid, acetic anhydride, KOH, anhydrous sodium sulfate, ethanol, and iodine were purchased from Sinopharm Chemical Reagents Co., Ltd.  $\text{NH}_3\text{BH}_3$ ,  $\text{MeNH}_2\text{BH}_3$ ,  $\text{Me}_2\text{NHBH}_3$ ,  $\text{Me}_3\text{NBH}_3$ ,  $\text{BH}_3\text{NH}_2\text{CH}_2\text{-CH}_2\text{NH}_2\text{BH}_3$  and HCl diethyl ether solution (1 mol  $\text{L}^{-1}$ ) were purchased from United Boron (Zhengzhou) Energy Materials S&T LLC and used as received. Tetrahydrofuran (THF), diethyl ether ( $\text{Et}_2\text{O}$ ), *n*-hexane, and toluene were dried over sodium and freshly distilled prior to use. *N,N*-Dimethylformamide (DMF) was dried by molecular sieves.

Amine chloroborane (**1a-d**) and  $\text{K}[\text{C}(\text{NO}_2)_3]$  were prepared according to the literature methods.<sup>11,19</sup>

**1a.** Yield: 92%;  $^{11}\text{B}$  NMR (128 MHz, THF):  $\delta -8.73$  (t,  $J_{\text{B-H}} = 114.3$  Hz) ppm (Fig. S5a†).  $^{11}\text{B}\{^1\text{H}\}$  NMR (128 MHz, THF):  $\delta -8.73$  (s) ppm (Fig. S5b†).

**1b.** Yield: 90%;  $^{11}\text{B}$  NMR (193 MHz, THF):  $\delta -6.36$  (t,  $J_{\text{B-H}} = 120.2$  Hz) ppm (Fig. S6a†).  $^{11}\text{B}\{^1\text{H}\}$  NMR (193 MHz, THF):  $\delta -6.36$  (s) ppm (Fig. S6b†).

**1c.** Yield: 86%;  $^{11}\text{B}$  NMR (193 MHz, THF):  $\delta -3.47$  (t,  $J_{\text{B-H}} = 120.6$  Hz) ppm (Fig. S7a†).  $^{11}\text{B}\{^1\text{H}\}$  NMR (193 MHz, THF):  $\delta -3.47$  (s) ppm (Fig. S7b†).

**1d.** Yield: 90%;  $^{11}\text{B}$  NMR (193 MHz, THF):  $\delta 0.21$  (t,  $J_{\text{B-H}} = 123.0$  Hz) ppm (Fig. S8a†).  $^{11}\text{B}\{^1\text{H}\}$  NMR (193 MHz, THF):  $\delta 0.21$  (s) ppm (Fig. S8b†).

$\text{K}[\text{C}(\text{NO}_2)_3]$ . Yield of 80%; IR ( $\text{cm}^{-1}$ ): 1589 (s), 1363 (s), 1301 (s), 823 (m), (Fig. S31†).

### Synthesis of $\text{ClBH}_2\text{NH}_2\text{CH}_2\text{CH}_2\text{NH}_2\text{BH}_2\text{Cl}$ (**1e**)

To a solution of ethylenediaminebisborane (0.088 g, 1 mmol) in THF (2 mL) was added HCl diethyl ether solution (2.2 mmol, 2.2 mL) *via* syringe at ambient temperature. The reaction was monitored by  $^{11}\text{B}$  NMR and after about 30 min the reaction was finished. Then the mixture was filtered and solvent was removed from the filtrate under a dynamic vacuum to leave a white product (0.144 g, yield 92%).  $^{11}\text{B}$  NMR (193 MHz,  $\text{CD}_3\text{CN}$ ):  $\delta -6.47$  (t,  $J_{\text{B-H}} = 107.7$  Hz) ppm (Fig. S9a†).  $^{11}\text{B}\{^1\text{H}\}$  NMR (193 MHz, THF):  $\delta -6.47$  (s) ppm (Fig. S9b†).

### Synthesis of $(\text{CH}_3)_3\text{NBH}_2\text{I}$ (**1f**)

To a solution of trimethylamine borane (0.073 g, 1 mmol) in toluene (2 mL) was added  $\text{I}_2$  (0.127 g, 0.5 mmol) in toluene (5 mL) *via* syringe at ambient temperature. The reaction was monitored by  $^{11}\text{B}$  NMR and after about 1 h the reaction was finished. After reaction, the mixture was filtered and solvent was

removed from the filtrate under a dynamic vacuum to leave a white product (0.169 g, yield 85%).  $^{11}\text{B}$  NMR (128 MHz, toluene):  $\delta -10.57$  (t,  $J_{\text{B-H}} = 130.9$  Hz) ppm (Fig. S10a†).  $^{11}\text{B}\{^1\text{H}\}$  NMR (128 MHz, toluene):  $\delta -10.57$  (s) ppm (Fig. S10b†).

### Synthesis of $[(\text{NH}_3)_2\text{BH}_2]\text{Cl}$ (**1g**)

Ammonia chloroborane (0.073 g, 1 mmol) was placed in a 10 mL flask, and the 2 mL of THF was injected into the flask. Then excess  $\text{NH}_3$  was bubbled into the flask at room temperature and white precipitate was formed immediately. After filtration, THF was removed from the filtrate under dynamic vacuum to leave a white powder product (0.078 g, yield 94%).  $^{11}\text{B}$  NMR (193 MHz, DMF):  $\delta -13.54$  (t,  $J_{\text{B-H}} = 104.4$  Hz) ppm (Fig. S11a†).  $^{11}\text{B}\{^1\text{H}\}$  NMR (193 MHz, DMF):  $\delta -13.54$  (s) ppm (Fig. S11b†).

### General procedure for the synthesis of $\text{ABH}_2\text{C}(\text{NO}_2)_3$ (**3a-c**)

To a solution of aminoborane (**1a**: 0.031 g; **2b**: 0.045 g; **2c**: 0.059 g) in THF (2 mL) was added HCl diethyl ether (1.1 mmol, 1.1 mL) *via* syringe at ambient temperature. The reaction was monitored by  $^{11}\text{B}$  NMR and after about 30 min the reaction was finished. Then the mixture was filtered and solvent was removed from the filtrate under a dynamic vacuum to leave the products of **1a-c**. The prepared **1a-c** and  $\text{K}[\text{C}(\text{NO}_2)_3]$  (0.208 g, 1.1 mmol) were added to the flask and then added 5 mL diethyl ether at ambient temperature. The yellow solid product was separated by filtration using a filter cannula and dried *in vacuo*.

**3a.** Yield: 65% (0.117 g);  $^{11}\text{B}$  NMR (193 MHz,  $\text{CD}_3\text{CN}$ )  $\delta -4.8$  (t,  $J_{\text{B-H}} = 115.9$  Hz) (Fig. S12a†).  $^{11}\text{B}\{^1\text{H}\}$  NMR (193 MHz,  $\text{CD}_3\text{CN}$ )  $\delta -4.8$  (s) (Fig. S12b†).  $^1\text{H}$  NMR (600 MHz,  $\text{CD}_3\text{CN}$ )  $\delta 4.4$  (t,  $J_{\text{N-H}} = 45.8$  Hz, 3H of  $\text{NH}_3$ ), 2.89–2.31 (m, 2H of  $\text{BH}_2$ ) (Fig. S13a†).  $^1\text{H}\{^{11}\text{B}\}$  NMR (600 MHz,  $\text{CD}_3\text{CN}$ )  $\delta 4.4$  (t,  $J_{\text{N-H}} = 45.8$  Hz, 3H of  $\text{NH}_3$ ), 2.61 (s, 2H of  $\text{BH}_2$ ) (Fig. S13b†). IR ( $\text{cm}^{-1}$ ): 3326 (s), 3217 (s), 2448 (w), 1566 (m), 1514 (s), 1411 (s), 1279 (s), 1176 (s), 794 (m), 734 (w) (Fig. S14†).

**3b.** Yield: 62% (0.120 g);  $^{11}\text{B}$  NMR (193 MHz,  $\text{CD}_3\text{CN}$ )  $\delta -2.32$  (t,  $J_{\text{B-H}} = 116.5$  Hz) (Fig. S15a†).  $^{11}\text{B}\{^1\text{H}\}$  NMR (193 MHz,  $\text{CD}_3\text{CN}$ )  $\delta -2.32$  (s) (Fig. S15b†).  $^1\text{H}$  NMR (600 MHz,  $\text{CD}_3\text{CN}$ )  $\delta 4.68$  (t,  $J_{\text{N-H}} = 44.0$  Hz, 2H of  $\text{NH}_2$ ), 2.95–2.13 (m, 2H of  $\text{BH}_2$ ), 2.35 (t,  $J_{\text{C-H}} = 5.8$  Hz, 3H of  $\text{CH}_3$ ) (Fig. S16a†).  $^1\text{H}\{^{11}\text{B}\}$  NMR (600 MHz,  $\text{CD}_3\text{CN}$ )  $\delta 4.68$  (t,  $J_{\text{N-H}} = 43.0$  Hz, 2H of  $\text{NH}_2$ ), 2.53 (s, 2H of  $\text{BH}_2$ ), 2.35 (t,  $J_{\text{C-H}} = 5.8$  Hz, 3H of  $\text{CH}_3$ ) (Fig. S16b†).  $^{13}\text{C}$  NMR (151 MHz,  $\text{CD}_3\text{CN}$ )  $\delta 29.48$  (Fig. S17†). IR ( $\text{cm}^{-1}$ ): 3438 (w), 3093 (w), 1514 (s), 1422 (s), 1384 (s), 1279 (s), 1177 (s), 927 (w), 794 (m), 734 (m) (Fig. S18†).

**3c.** Yield: 67% (0.139 g);  $^{11}\text{B}$  NMR (193 MHz,  $\text{CD}_3\text{CN}$ )  $\delta 0.22$  (t,  $J_{\text{B-H}} = 117.1$  Hz) (Fig. S19a†).  $^{11}\text{B}\{^1\text{H}\}$  NMR (193 MHz,  $\text{CD}_3\text{CN}$ )  $\delta 0.22$  (s) (Fig. S19b†).  $^1\text{H}$  NMR (600 MHz,  $\text{CD}_3\text{CN}$ )  $\delta 4.92$  (s,  $^1\text{H}$  of NH), 2.48 (d,  $J_{\text{C-H}} = 5.7$  Hz, 6H of  $\text{CH}_3$ ), 2.90–2.09 (m, 2H of  $\text{BH}_2$ ) (Fig. S20a†).  $^1\text{H}\{^{11}\text{B}\}$  NMR (600 MHz,  $\text{CD}_3\text{CN}$ )  $\delta 4.92$  (s,  $^1\text{H}$  of NH), 2.48 (d,  $J_{\text{C-H}} = 5.8$  Hz, 6H of  $\text{CH}_3$ ), 2.47 (s, 2H of  $\text{BH}_2$ ) (Fig. S20b†).  $^{13}\text{C}$  NMR (151 MHz,  $\text{CD}_3\text{CN}$ )  $\delta 39.55$  (Fig. S21†). IR ( $\text{cm}^{-1}$ ): 3441 (m), 3058 (m), 2779 (m), 2435 (w), 1496 (s), 1422 (s), 1384 (s), 1277 (s), 1161 (m), 1022 (w), 924 (w), 793 (m), 733 (m) (Fig. S22†).

### Synthesis of $[\text{CH}_2\text{NH}_2\text{BH}_2\text{C}(\text{NO}_2)_3]_2$ (**3e**)

To a solution of ethylenediaminebisborane (0.088 g, 1 mmol) in THF (2 mL) was added HCl diethyl ether solution (2.2 mmol, 2.2 mL) *via* syringe at ambient temperature. The reaction was monitored by  $^{11}\text{B}$  NMR and after about 30 min the reaction was finished. Then the solvent was removed from the filtrate under a dynamic vacuum to leave product. The prepared **1e** and K  $[\text{C}(\text{NO}_2)_3]$  (0.416 g, 2.2 mmol) were added to the flask and then added 5 mL diethyl ether at ambient temperature. The yellow solid product was separated by filtration using a filter cannula and dried *in vacuo*.

**3e.** Yield: 62% (0.239 g);  $^{11}\text{B}$  NMR (193 MHz,  $\text{CD}_3\text{CN}$ )  $\delta$  -2.93 (t,  $J_{\text{B-H}} = 116.6$  Hz) (Fig. S23a $\dagger$ ).  $^{11}\text{B}\{\text{H}\}$  NMR (193 MHz,  $\text{CD}_3\text{CN}$ )  $\delta$  -2.94 (s) (Fig. S23b $\dagger$ ).  $^1\text{H}$  NMR (600 MHz,  $\text{CD}_3\text{CN}$ )  $\delta$  4.91 (s, 2H of  $\text{NH}_2$ ), 2.98 (s, 3H of  $\text{CH}_3$ ), 2.90–2.18 (m, 2H of  $\text{BH}_2$ ) (Fig. S24a $\dagger$ ).  $^1\text{H}\{^{11}\text{B}\}$  NMR (600 MHz,  $\text{CD}_3\text{CN}$ )  $\delta$  4.91 (s, 2H of  $\text{NH}_2$ ), 2.98 (s, 3H of  $\text{CH}_3$ ), 2.56 (s, 2H of  $\text{BH}_2$ ) (Fig. S24b $\dagger$ ).  $^{13}\text{C}$  NMR (151 MHz,  $\text{CD}_3\text{CN}$ )  $\delta$  42.28 (Fig. S25 $\dagger$ ). IR ( $\text{cm}^{-1}$ ): 3172 (w), 3057 (w), 1608 (w), 1519 (w), 1361 (m), 1296 (s), 1087 (m), 1032 (m), 918 (m), 822 (m), 778 (m), 692 (m), 461 (w) (Fig. S26 $\dagger$ ).

### Synthesis of $[\text{H}_2\text{B}(\text{NH}_3)_2][\text{C}(\text{NO}_2)_3]$ (**3g**)

To a solution of ammonia borane (0.031 g, 1 mmol) in THF (2 mL) was dropwise added HCl diethyl ether (1.1 mmol, 1.1 mL) *via* syringe at ambient temperature. The white solid product (**1a**) was separated by filtration using a filter cannula dried *in vacuo* for use.

(a) Repeated the literature method. The prepared **1a** was placed in a flask, and the 2 mL of THF was injected into the flask. Then excess  $\text{NH}_3$  was bubbled into the flask for 30 min under stirring at room temperature and white precipitate was produced immediately. Then  $\text{K}[\text{C}(\text{NO}_2)_3]$  (0.208 g, 1.1 mmol) in THF (5 mL) was added into the flask, the reaction mixture was stirred for 2 h and the solution turned from colourless and transparent to yellow. After filtration to remove the formed KCl, THF was removed from the filtrate under dynamic vacuum to give a yellow powder product (**3g**, 0.129 g, yield 65%).

(b) The prepared **1a** and  $\text{K}[\text{C}(\text{NO}_2)_3]$  (0.208 g, 1.1 mmol) were added to a flask and then 5 mL of liquid  $\text{NH}_3$  was condensed into the flask at  $-78$  °C and stirred for 2 hours. Then the reaction was warm up to room temperature and liquid  $\text{NH}_3$  was volatilized completely to leave white and yellow powder precipitate (KCl and **3g**). The yellow precipitate was extracted with 20 mL of THF. Removal of THF from the filtrate under dynamic vacuum gave a yellow powder product (0.133 g, yield 68%).

(c) The prepared **1a** and  $\text{K}[\text{C}(\text{NO}_2)_3]$  (0.208 g, 1.1 mmol) were added to a flask and the 5 mL of ethyl ether was injected into the flask. The reaction was stirred for 2 h, then excess  $\text{NH}_3$  was bubbled into the flask and white precipitate was produced immediately, the solution turned to yellow. Removal of ethyl ether from the filtrate under dynamic vacuum gave a yellow product (**3g**, 0.117 g, yield 59%).

**3g.**  $^{11}\text{B}$  NMR (193 MHz,  $\text{CD}_3\text{CN}$ )  $\delta$  -13.06 (t,  $J_{\text{B-H}} = 110.9$  Hz) (Fig. S27a $\dagger$ ).  $^{11}\text{B}\{\text{H}\}$  NMR (193 MHz,  $\text{CD}_3\text{CN}$ )  $\delta$  -13.05 (s) (Fig. S27b $\dagger$ ).  $^1\text{H}$  NMR (600 MHz,  $\text{CD}_3\text{CN}$ )  $\delta$  4.40 (t,  $J_{\text{N-H}} =$

47.4 Hz, 6H of  $\text{NH}_3$ ), 2.40–1.56 (m, 2H of  $\text{BH}_2$ ) (Fig. S28a $\dagger$ ).  $^1\text{H}\{^{11}\text{B}\}$  NMR (600 MHz,  $\text{CD}_3\text{CN}$ )  $\delta$  4.40 (t,  $J_{\text{N-H}} = 47.6$  Hz, 6H of  $\text{NH}_3$ ), 2.02 (m, 2H of  $\text{BH}_2$ ) (Fig. S28b $\dagger$ ). IR ( $\text{cm}^{-1}$ ): 3274 (m), 2444 (w), 2409 (w), 2338 (w), 1514 (s), 1408 (s), 1384 (s), 1273 (s), 1173 (m), 1093 (w), 1028 (w), 869 (w), 792 (s), 734 (s), 693 (w) (Fig. S29 $\dagger$ ).
