## Recent advances in the application of magnetic bio-polymers as catalysts in multicomponent reactions

Zohreh Kheilkordi, Da Ghodsi Mohammadi Ziarani, Da Fatemeh mohajer, Da Alireaza Badiei Da and Mika Sillanpää<sup>cde</sup>

Magnetic nanoparticles have attracted significant attention due to their high surface area and superparamagnetic properties. Bio-polymers composed of polysaccharides including alginate, cellulose, glucose, dextrin, chitosan, and starch can be immobilized on magnetic nanoparticles. Bio-polymers can be obtained from natural sources, such as plants, tunicates, algae, and bacteria. Bio-polymers obtained from natural sources have attracted attention due to their various properties including efficient functional groups, non-toxicity, low cost, availability, and biocompatibility. According to the targets of "green chemistry", the application of bio-polymers is effective in reducing pollution. Furthermore, they are excellent agents for the functionalization of magnetic nanoparticles to yield nanomagnetic bio-polymers, which can be applied as recoverable and eco-friendly catalysts in multicomponent reactions.

#### Introduction

Among the various magnetic nanoparticles, nano magnetic iron oxide (Fe<sub>3</sub>O<sub>4</sub>) is very important because of its low cost, easy synthesis, and high magnetic ability. Recently, magnetic nanoparticles have been extensively applied in various fields including drug delivery, sensing, water treatment, removal of heavy metals, and catalysis. However, they are unstable in alkaline and acidic media due to the easy oxidation of their surface area.1-8 These drawbacks can be alleviated via the modification of Fe<sub>3</sub>O<sub>4</sub> nanoparticles with materials such as silanes, 9,10 activated carbon, 11 and biocompatible polymers. 12,13 Another class of magnetic nanoparticles is ferrite magnetic nanomaterials and hexaferrite (M-type). Ferrite magnetic nanomaterials and hexaferrite have various applications including high chemical strength materials, home appliances, supercapacitors, loudspeakers, electromagnetic wave absorption, and permanent magnets. 14-18 Overall, due to the properties of ferrite magnetic nanomaterials and hexaferrite (M-type), they

The design and synthesis of biocompatible magnetic nanoparticles are important subjects in green chemistry.<sup>24</sup> Biopolymers including alginate, cellulose, glucose, dextrin, chitosan, and starch are known as polysaccharides, which are present in the carbohydrates in plants, animals, microbes, and algae (Fig. 1).<sup>24</sup> These bio-polymers have different properties such as biodegradable nature, biocompatibility, non-toxicity, availability, low cost, and heat resistantance.<sup>25</sup> They are excellent agents for the functionalization of magnetic nanoparticles to yield nanomagnetic bio-polymers, promoting their longevity, hardness, and strength. These composites have many applications such as drug delivery,<sup>26–28</sup> chemotherapy,<sup>29,30</sup> magnetic resonance imaging (MRI) agents,<sup>31,32</sup> solar cells,<sup>33</sup> chemical sensors,<sup>34,35</sup> catalysts,<sup>36</sup> water treatment,<sup>37,38</sup> and biomedical sensors,<sup>39</sup>

In comparison to conventional catalysts, heterogeneous magnetic bio-polymers have various advantages such as non-toxicity, easy separation, and eco-friendly nature. According to the functional groups on the magnetic nanoparticles, the catalysts can be grouped in various categories including, Lewis and Brønsted acids and bases. 40,41 In continuation of our research, 42-44 in this review, the importance of nanomagnetic bio-polymers is studied in multicomponent reactions. Multicomponent reactions (MCRs) are essential tools in medicinal and organic chemistry, which have various advantages including simplicity, easy workup, availability, and reduced generation of waste. Hence, the design and application of MCRs for the synthesis of organic compounds are highly important. 45-50

can be used for the adsorption of various metals ions, cationic and anionic dyes from wastewater.<sup>19–23</sup>

Review

# 2. Synthesis of various magnetic bio polymers

#### 2.1. Magnetic bio-polymers based on cellulose

Starch

2.1.1. Synthesis and application of Fe<sub>3</sub>O<sub>4</sub>/cellulose/Co-MOF nanocomposite. Initially, Fe<sub>3</sub>O<sub>4</sub> nanoparticles 4 were modified with cellulose 5 using urea 6/NaOH 7 to provide Fe<sub>3</sub>O<sub>4</sub>/cellulose 8, which was reacted with Co(NO<sub>3</sub>)<sub>2</sub>·6H<sub>2</sub>O 9, terephthalic acid 10, and imidazole (IM) 11 in DMF to form Fe<sub>3</sub>O<sub>4</sub>/cellulose/Co-MOF nanocomposite 12 (Scheme 1).<sup>51</sup>

 ${\rm Fe_3O_4/cellulose/Co\text{-}MOF}$  12 has two sites including Lewis acidic sites ( ${\rm Co^{2^+}}$ ) and basic sites (IM), which were used in the Knoevenagel condensation reaction of aromatic aldehydes 13 with malononitrile 14 under solvent-free conditions (Scheme 2). This catalyst was reused five times without a decrease its catalytic activity.  $^{51}$ 

2.1.2. Synthesis and application of Fe<sub>3</sub>O<sub>4</sub>@NCs/Sb(v). Initially, raw cotton was converted to nano-cellulose (NCs) 5 in the presence of NaOH 7, NaClO 16, and  $\rm H_2SO_4$  17 at 80 °C. Then, Fe<sub>3</sub>O<sub>4</sub> was functionalized with nano-cellulose (NCs) 5, providing Fe<sub>3</sub>O<sub>4</sub>@NCs 8. In the next step, SbCl<sub>5</sub> was mixed with the reaction mixture in chloroform to provide Fe<sub>3</sub>O<sub>4</sub>@NCs/Sb(v) 18 (Scheme 3).<sup>52</sup>

Fe $_3$ O $_4$ @NCs/Sb(v) was used as a Lewis acid for the activation of carbonyl groups, which was investigated in the synthesis of 4*H*-pyrimido[2,1-*b*]benzothiazoles 22 *via* the three-component reaction of aldehydes 19, 2-aminobenzothiazole 20, and ethylacetoacetate 21 under solvent-free conditions at 90 °C (Scheme 4). This catalyst was used five times without loss in its catalytic activity, which was compared with Fe $_3$ O $_4$  with 39% yield in 3 h. $_5$ 2

2.1.3. Synthesis and application of Fe<sub>3</sub>O<sub>4</sub>@NFC@Co( $\pi$ ). Fe<sub>3</sub>O<sub>4</sub> MNPs were synthesized *via* the reaction of FeCl<sub>3</sub>·6H<sub>2</sub>O and FeSO<sub>4</sub>·7H<sub>2</sub>O in the presence of NH<sub>4</sub>OH solution at 80 °C under an N<sub>2</sub> atmosphere. The Fe<sub>3</sub>O<sub>4</sub> nanoparticles were dispersed in H<sub>2</sub>O<sub>4</sub> and then nanofiber cellulose (NFC) 24 was

added to the reaction mixture at room temperature to obtain  $Fe_3O_4@NFC$  **25** precipitate, which was reacted with an ethanolic solution of cobalt(II) acetate to form  $Fe_3O_4@NFC@Co(II)$  **26** (Scheme 5).<sup>53</sup>

Glucose

Its catalytic activity was useful for the synthesis of 4*H*-pyrans *via* the multicomponent reaction of aldehydes, ethylacetoacetate, and malononitrile in H<sub>2</sub>O (Scheme 6).<sup>53</sup>

Also, the catalytic activity of **26** was tested for the synthesis of pyranopyrazole derivatives **29** via the four-component reaction of hydrazine hydrate **28**, ethyl acetoacetate **21**, benzaldehyde **19**, and malononitrile **14** in H<sub>2</sub>O (Scheme 7). The metal ions on the catalyst surface act as Lewis acids, which were activated by the malononitrile and carbonyl groups. Also, the catalyst was used five times in the model reaction without a reduction in activity.<sup>53</sup>

2.1.4. Synthesis and application of cellulose@pumice. Initially, the microcrystalline cellulose was mixed with a solution of NaOH 7 and urea 6 in  $\rm H_2O$ , and then was cooled in an ice bath at 8 °C to form a gel solution, which was mixed with pumice powder 32 and stirred for 24 h to obtain cellulose@pumice 33 (Scheme 8).<sup>54</sup>

Cellulose@pumice as an acidic catalyst activated carbonyl groups in the synthesis of 2,4,5-triarylimidazoles 36 through the reaction of benzaldehyde 19 and ammonium acetate 35 in EtOH under ultrasonic irradiation (Scheme 9). In the reusability test, this catalyst was used ten times without a reduction in activity.<sup>54</sup>

2.1.5. The synthesis and application of  $(Fe_3O_4@-NFC@NSalophCu)CO_2H$ . Nanofiber cellulose 37 was functionalized with  $Fe_3O_4$  via the sol–gel method to give  $Fe_3O_4@NFC$  nanoparticles 39, which were functionalized with (3-aminopropyl)triethoxysilane (APTES) 40 to obtain  $Fe_3O_4@-NFC@APTES$  41. The reaction of salicylaldehyde 42, paraformaldehyde 43, and HCl solution under reflux conditions provided 5-chloromethyl salicylaldehyde 44, which was reacted with 3,5-diaminobenzoic acid 45 in  $CH_2Cl_2$  at room temperature to give the Schiff base 3,5-bis(((*E*)-5-(chloromethyl)-2-

Scheme 1 Synthesis of Fe<sub>3</sub>O<sub>4</sub>/cellulose/Co-MOF nanocomposite 12

hydroxybenzylidene)amino) benzoic acid ((5-Cl-Saloph)CO<sub>2</sub>H) **46**, followed by reaction with copper acetate in EtOH at room temperature to obtain complex [(5-Cl-Saloph)Cu( $\pi$ )]CO<sub>2</sub>H **47**. Finally, the reaction of [(5-Cl-Saloph)Cu( $\pi$ )]CO<sub>2</sub>H complex **47** and Fe<sub>3</sub>O<sub>4</sub>@NFC@APTES **41** at 70 °C for 24 h gave (Fe<sub>3</sub>O<sub>4</sub>@-NFC@NSalophCu)CO<sub>2</sub>H **48** (Scheme 10).<sup>55</sup>

 $(Fe_3O_4@NFC@NSalophCu)CO_2H$  **48** was tested in the synthesis of 5-substituted-1*H*-tetrazole **51** *via* the multicomponent reaction of various aldehydes **19**, hydroxylamine **49**, and sodium azide **50** (Scheme 11), and also in the synthesis of 1-substituted-1*H*-tetrazoles **54** *via* the multicomponent reaction of aniline **52**, triethyl orthoformate **53**, and sodium azide **50** (Scheme 12). This catalyst was used in the click reaction four times without a decrease in its activity. In this catalyst, copper metal plays a vital role in the click reactions. <sup>55</sup>

**2.1.6.** Synthesis and application of Fe<sub>3</sub>O<sub>4</sub>@NFC@NNSM-Mn(III). Fe<sub>3</sub>O<sub>4</sub> nanoparticles were functionalized with NFC nanospheres to prepare Fe<sub>3</sub>O<sub>4</sub>@NFC 39, which was dispersed in toluene, and then 3-chloropropyl-trimethoxy silane 55 was added to the reaction mixture under N<sub>2</sub> gas and reflux conditions to obtain Fe<sub>3</sub>O<sub>4</sub>@NFC-Cl 56, followed by reaction with o-phenylenediamine 54 in CH<sub>2</sub>Cl<sub>2</sub> under reflux conditions to give Fe<sub>3</sub>O<sub>4</sub>@NFC@NN 57. Then, 5-(chloromethyl)-2-hydroxy benzaldehyde 58 was reacted with Fe<sub>3</sub>O<sub>4</sub>@NFC@NN 57 to form Fe<sub>3</sub>O<sub>4</sub>@NFC@NNS 59, which was complexed with

Mn(OAc)<sub>3</sub>·  $2H_2O$  **60** in EtOH to prepare Fe<sub>3</sub>O<sub>4</sub>@NFC@NNS-Mn **61**, followed by reaction with melamine **62** in the presence of triethylamine in MeOH to generate Fe<sub>3</sub>O<sub>4</sub>@NFC@NNSM-Mn(III) **63** (Scheme 13).<sup>56</sup>

The activity of Fe $_3$ O $_4$ @NFC@NNSM-Mn(III) **63** was tested for the synthesis of xanthenes **65** *via* the pseudo-three-component reaction of aldehydes **19** and dimedone **64** in EtOH at 45 °C (Scheme 14). The manganese metal on the surface of Fe $_3$ O $_4$ @-NFC@NNSM-Mn(III) acts as a Lewis acid to activate the carbonyl groups. This catalyst was used five times without a decrease in its activity.<sup>56</sup>

2.1.7. Synthesis and application of Fe<sub>3</sub>O<sub>4</sub>@NFC@ONSM-Ni( $\pi$ ). Initially, Fe<sub>3</sub>O<sub>4</sub>@NFC 39 was functionalized with 3-chloropropyl-trimethoxy silane 55 to obtain Fe<sub>3</sub>O<sub>4</sub>@-NFC@CPTMS 56. Subsequently, 2-hydroxy 4-chloromethyl benzaldehyde 44 was prepared *via* the reaction of salicylaldehyde 42, paraformaldehyde 43, and HCl 37% in the presence of H<sub>2</sub>SO<sub>4</sub> as a catalyst at 70 °C for 20 h. In the next step, the Schiff base ligand was synthesized *via* the reaction of 2-aminophenol 66 and 5-chloromethylsalicyaldehyde 67 in dichloromethane at 40 °C for 3 h. Then, Fe<sub>3</sub>O<sub>4</sub>@NFC@ONS 68 was obtained through the reaction of 4-(chloromethyl)-2-(((2-hydroxyphenyl)imino) methyl) phenol 67 and Fe<sub>3</sub>O<sub>4</sub>@NFC@CPTMS 68 in the presence of triethylamine in acetonitrile under reflux conditions. In the next step, Fe<sub>3</sub>O<sub>4</sub>@NFC@ONS 68 was reacted with Ni(OAc)<sub>2</sub>

Scheme 2 Knoevenagel condensation in the presence of  $Fe_3O_4/cellulose/Co-MOF$  12.

in EtOH at room temperature for 12 h to obtain Fe $_3O_4$ @-NFC@ONS-Ni( $\pi$ ) **69.** Finally, Fe $_3O_4$ @NFC@ONSM-Ni( $\pi$ ) **70** was synthesized as a nanocatalyst  $\nu ia$  the reaction of Fe $_3O_4$ @NFC@ONS-Ni( $\pi$ ) **69** and melamine **62** in the presence of triethylamine in the MeOH under reflux conditions and N $_2$  gas for 12 h (Scheme 15).

This catalyst was used in the synthesis of polyhydroquinolines 72 through the Hantzsch reaction among benzaldehydes 19, dimedone 64, ethyl acetoacetate 21, and ammonium acetate 71 (Scheme 16).<sup>57</sup>

Also, Bagherzade *et al.* applied this catalyst in the synthesis of 1,4-dihydropyridine 72 *via* the multicomponent reaction of aldehydes 19, ethyl acetoacetate 21, and ammonium acetate 71 (Scheme 17). The carbonyl groups in the multi-component reaction were activated in the presence of nickel metal on the surface of Fe<sub>3</sub>O<sub>4</sub>@NFC@ONSM-Ni(II) as a Lewis acid. Also, this catalyst was tested 6 times without loss in its activity.<sup>57</sup>

2.1.8. Synthesis and application of cell-LA-TEA $^{\dagger}$ /Fe $_3$ O $_4$ . Initially, cellulose 5 was reacted with tosyl chloride 74 in the

R= H, 4-NO<sub>2</sub>, 4-Cl, 4-Br, 2-Cl, 3-NO<sub>2</sub>, 3-OH, 2,4-(Cl)<sub>2</sub>, 2,4-(OMe)<sub>2</sub>, 3,4-(OH)<sub>2</sub>

**Scheme 4** Synthesis of 4*H*-pyrimido[2,1-*b*]benzothiazole derivatives **22**.

presence of  $Et_3N$  to form cell-tosyl 75, which was reacted with lactic acid 76 to produce cell-LA 77, followed by reaction with triethanolamine 78 to prepare cell-LA-TEA<sup>+</sup> 79. Finally, cell-LA-TEA<sup>+</sup> 79 was magnetized *via* the reaction of  $FeCl_3 \cdot 6H_2O$ ,  $FeCl_2 \cdot 4H_2O$ , and ammonium solution in aqueous media to form cell-LA-TEA<sup>+</sup>/ $Fe_3O_4$  80 (Scheme 18).<sup>58</sup>

Cell-LA-TEA $^+$ /Fe $_3$ O $_4$  was used as a catalyst for the regiose-lective synthesis of pyrazolo quinolones **82** *via* the three-component reaction of dimedone **64**, 5-amino pyrazolone **81**, and aromatic aldehydes **19** in EtOH/H $_2$ O under ultrasonic irradiation (Scheme **19**). The catalyst was used with high stability in 7 cycles without loss in its activity. $^{58}$ 

2.1.9. Synthesis and application of Fe<sub>3</sub>O<sub>4</sub>@nano-cellulose-OPO<sub>3</sub>H. Initially, nano-cellulose 5 was prepared from cotton. Then, Fe<sub>3</sub>O<sub>4</sub>@nano-cellulose (Fe<sub>3</sub>O<sub>4</sub>@nCs) 8 was obtained through the reaction of nano-cellulose solution in acetic acid with FeCl<sub>3</sub>·6HO<sub>2</sub>, FeCl<sub>2</sub>·4H<sub>2</sub>O, and ammonium hydroxide at 80 °C. Finally, Fe<sub>3</sub>O<sub>4</sub>@nCs were immobilized with P<sub>4</sub>O<sub>10</sub> at room temperature under grinding conditions to produce Fe<sub>3</sub>-O<sub>4</sub>@nCS-PA 83 (Scheme 20).<sup>59</sup>

2,3-Dihydroquinazolin-4(1H)-ones 85 were prepared *via* the condensation reaction of 2-aminobenzamide 84 and aldehydes 19 in the presence of Fe<sub>3</sub>O<sub>4</sub>@NCS-PA 83 as a Brønsted acid in H<sub>2</sub>O: EtOH under reflux conditions (Scheme 21). The main

Scheme 7 Synthesis of pyranopyrazole derivatives 29 using  $Fe_3O_4$ @NFC@Co(II).

advantages of this method are its excellent yields, simple workup, and eco-friendly catalyst. This reaction was accomplished in  $\rm H_2O$ : EtOH under reflux conditions in the presence of  $\rm Fe_3O_4$  with 60% yield; however,  $\rm Fe_3O_4@NCS\text{-PA}$  performed better than  $\rm Fe_3O_4$  in this reaction.  $^{59}$ 

2.1.10. Synthesis and application of Fe $_3$ O $_4$ @NCs/Cu( $_1$ ). Fe $_3$ O $_4$  was functionalized with nano-cellulose 5 to obtain

R= H, 2,4-(Cl)<sub>2</sub>, 2-NO<sub>2</sub>, 3-OH, 2-Cl, 4-Cl, 3,4-(OMe)<sub>2</sub>, 4-OMe, 2,5-(OMe)<sub>2</sub>, 3,4,5-(OMe)<sub>3</sub>

Scheme 9 Synthesis of 2,4,5-triarylimidazoles derivatives 36

Fe<sub>3</sub>O<sub>4</sub>@NCs **8**, which was added to NaOH solution to give Fe<sub>3</sub>-O<sub>4</sub>@NCs **8**, followed by reaction with CuCl<sub>2</sub> to provide Fe<sub>3</sub>-O<sub>4</sub>@NCs/Cu(II) **86** (Scheme 22).<sup>60</sup>

 ${\rm Fe_3O_4@NCs/Cu(II)}$  as a Lewis acid activated the carbonyl groups of the starting materials by copper metal in the synthesis of indenopyrido[2,3-d]pyrimidines **89** through the three-component reaction of 6-amino-2-(methylthio)pyrimidin-4(3H)-one **88**, 1,3-indanedione **87** and aldehydes **19** in EtOH (Scheme 23). The activity of the catalyst was preserved after four runs.<sup>60</sup>

2.1.11. Synthesis and application of Fe $_3$ O $_4$ @nano-cellulose/Cu(II). The reaction of nano-cellulose 5, FeCl $_3 \cdot 6$ H $_2$ O, FeCl $_2 \cdot 4$ H $_2$ O, and NH $_4$ OH at 80 °C gave Fe $_3$ O $_4$ @nano-cellulose 8, which was reacted with CuCl $_2$  using sodium hydroxide at room temperature to obtain Fe $_3$ O $_4$ @nano-cellulose/Cu(II) 90 (Scheme 24).

Cu(II) in  $Fe_3O_4$ @nanocellulose/Cu(II), as a Lewis acid, activated the carbonyl groups in the three-component reaction of

Scheme 8 Synthesis of cellulose@pumice 33.

aromatic aldehydes 19, 2-aminobenzothiazole 20, and ethyl acetoacetate 21 for the synthesis of 4H-pyrimido[2,1-b]benzothiazoles 22 (Scheme 25). The catalyst activity of Fe<sub>3</sub>O<sub>4</sub>@nanocellulose/Cu(II) was preserved after four runs. The yield of this reaction in the presence of Fe<sub>3</sub>O<sub>4</sub> as a catalyst after 3 h was reported to be about 37%. Therefore, Fe<sub>3</sub>O<sub>4</sub>@nano-cellulose/ Cu(II) is more active than Fe<sub>3</sub>O<sub>4</sub>.61

2.1.12. Synthesis and application of Fe<sub>3</sub>O<sub>4</sub>@NFC-ImSalophCu(II). Initially, imidazole 11 was treated with 3-

R= H, 4-Cl, 4-Br, 4-Me, 4-OMe, 4-NO<sub>2</sub>, 3-Cl, 3-Br, 3-Me, 3-OMe

Scheme 12 Synthesis of 1-substituted-1H-tetrazoles using (Fe<sub>3</sub>O<sub>4</sub>@-NFC@NSalophCu)CO<sub>2</sub>H.

chloropropyl-trimethoxy silane 55 in toluene to produce imidazole-propyl-trimethoxy silane 91, which was immobilized on Fe<sub>3</sub>O<sub>4</sub>@NFC 39 using Et<sub>3</sub>N as a catalyst in dry toluene to give Fe<sub>3</sub>O<sub>4</sub>@NFC-Im 92. The reaction of salicylaldehyde 42 and paraformaldehyde 43 in the presence of HCl/H2SO4 gave 5-(chloromethyl)-2-hydroxybenz aldehyde 44, which was reacted with 1,2-phenylenediamine 93 in dichloromethane under reflux

Scheme 13 Synthesis of Fe<sub>3</sub>O<sub>4</sub>@NFC@NNSM-Mn(III).

conditions to produce N,N-bis(5-chloromethylsalicylidene)-1,2-phenylenediamine **94**, followed by reaction with  $Cu(OAc)_2$  in EtOH at room temperature to prepare 5-Cl-Salophen-Cu( $\pi$ ) **95**. Finally, Fe<sub>3</sub>O<sub>4</sub>@NFC-ImSalophCu( $\pi$ ) **96** was synthesized via the

reaction of Fe $_3$ O $_4$ @NFC-Im **92** and 5-Cl-Salophen-Cu(II) **95** in toluene under reflux conditions (Scheme 26).

The copper of Fe<sub>3</sub>O<sub>4</sub>@NFC-ImSalophCu **96** was applied in the click reaction of phenacyl bromides **97**, sodium azide **90**,

and alkynes **98** in  $H_2O$  to synthesize 1,2,3-triazoles **99** (Scheme 27). The reusability of this catalyst was tested in the click reaction four times without loss in its activity.<sup>62</sup>

2.1.13. Synthesis and application of Fe<sub>3</sub>O<sub>4</sub>@walnut shell/Cu(II) Nanomagnetic Fe<sub>3</sub>O<sub>4</sub>@walnut shell/Cu(II) was prepared by Mirjalili's research group. Nanomagnetic Fe<sub>3</sub>O<sub>4</sub>@walnut shell/Cu(II) **100** was prepared  $\nu ia$  the reaction of dried powdered walnut shell with NaOH, hypochlorite solution, and sulfuric acid aqueous to afford a nano walnut shell, followed by reaction with CH<sub>3</sub>COOH, FeCl<sub>3</sub>·6H<sub>2</sub>O **1**, FeCl<sub>2</sub>·4H<sub>2</sub>O<sub>2</sub>, and NH<sub>4</sub>OH to generate nanomagnetic Fe<sub>3</sub>O<sub>4</sub>@walnut shell **8**, which was modified by CuCl<sub>2</sub>·2H<sub>2</sub>O/NaOH to produce nanomagnetic Fe<sub>3</sub>O<sub>4</sub>@walnut shell/Cu(II) **100** (Scheme 28).

Its catalytic activity was explored using 2-aryl/alkyl-2,3-dihydro-1H-naphtho[1,2-e][1,3]oxazines 102 or 104 or 106 via the pseudo-three-component reaction of  $\beta$ -naphthol 101 or  $\alpha$ -naphthol 103 or phenol derivatives 105, formaldehyde 52, and various amines 43 (Scheme 29). The catalytic activity of nano-Fe<sub>3</sub>O<sub>4</sub>@walnut shell/Cu did not decrease after five-times use. The copper metal on the nano-Fe<sub>3</sub>O<sub>4</sub>@walnut shell/Cu( $\pi$ ) increased the reaction rate via interaction with the carbonyl group of the starting materials.

#### 2.2. Magnetic bio-polymers based on dextrin

**2.2.1.** Synthesis and application of magnetic dextrin nanocomposite. Dextrin **107** is a water-soluble polysaccharide obtained via the hydrolysis of starch and glycogen. Magnetic dextrin nanocomposite **108** was prepared via the addition of dextrin **107** to a solution of FeCl<sub>3</sub>·6H<sub>2</sub>O, FeCl<sub>2</sub>·4H<sub>2</sub>O, and ammonium hydroxide at 90 °C under an N<sub>2</sub> atmosphere via the co-precipitation method (Scheme 30).<sup>64</sup>

The magnetic dextrin was tested as a catalyst in the synthesis of polyhydroquinolines *via* four-component reactions of aromatic aldehydes **19**, ethyl acetoacetate **21**, dimedone **61**, ammonium acetate **71** in EtOH under reflux conditions (Scheme 31). The yield of the products did not decrease after five runs. This reaction was performed in the presence of dextrin in ethanol in 28% yield, and thus magnetic dextrin is better than dextrin to catalyze this reaction.<sup>64</sup>

2.2.2. Synthesis and application of magnetized dextrin. Magnetized dextrin 72 was obtained via the reaction of FeCl<sub>3</sub>·6H<sub>2</sub>O, FeCl<sub>2</sub>·4H<sub>2</sub>O, dextrin 71, and NH<sub>4</sub>OH in H<sub>2</sub>O at 90 °C under a nitrogen atmosphere (Scheme 32).<sup>65</sup>

Maleki *et al.* studied the catalytic activity of magnetized dextrin **29** for the synthesis of dihydropyrano[2,3-*c*]pyrazoles **29** through the reaction of hydrazine hydrate **28**, ethyl acetoacetate **21**, aromatic aldehydes **19**, and malononitrile **14** under reflux conditions in EtOH (Scheme 33). This catalyst was used for five runs without a decrease in its catalytic activity.<sup>65</sup>

2.2.3. Synthesis and application of FND-Ti(v). Fe<sub>3</sub>O<sub>4</sub>@nano-dextrin 108 was prepared through the reaction of nano-dextrin 107, FeCl<sub>3</sub>·6H<sub>2</sub>O, FeCl<sub>2</sub>·4H<sub>2</sub>O, and ammonia solution in H<sub>2</sub>O at 80 °C. Fe<sub>3</sub>O<sub>4</sub>@nano-dextrin 108 was coated with TiCl<sub>4</sub> in CH<sub>2</sub>Cl<sub>2</sub> to prepare FND-Ti(v) 109 (Scheme 34).<sup>66</sup>

Its catalytic activity as a Lewis acid was investigated in the synthesis of 2,3-dihydroquinazolin-4(1*H*)-ones **85** *via* the condensation reaction of 2-aminobenzamide **84** and aldehydes **19** under mild conditions (Scheme 35). This catalyst was used five times without loss in its catalytic activity. <sup>66</sup>

#### 2.3. Magnetic bio-polymers based on starch

2.3.1. Synthesis and application of magnetic Ag/Fe<sub>3</sub>O<sub>4</sub>@starch nanocatalyst. To aqueous starch solution 110, citric acid 111 and sodium hypophosphite 112 were added and refluxed to give the precipitate crude product, which was crushed and dried to give cross-linked starch 113, followed by dissolving in  $H_2O$  to produce gelatinized starch 114. The obtained gelatinized starch was reacted with  $FeCl_3 \cdot 6H_2O$ , and  $FeSO_4 \cdot 7H_2O$  in  $H_2O$  at room temperature, and then mixed with  $NH_3$  dropwise to give the  $Fe_3O_4$ @starch nanocatalyst, which was treated with Ag $NO_3$  (aq) to generate the magnetic Ag/Fe<sub>3</sub>O<sub>4</sub>@starch 115 nanocatalyst (Scheme 36).<sup>67</sup>

The catalytic activity of Ag/Fe<sub>3</sub>O<sub>4</sub>@starch as Lewis acid **115** was evaluated in the one-pot reaction of benzaldehydes **19**, malononitrile **14**, and dimedone **64** in EtOH for the synthesis of 4*H*-pyran **116** (Scheme 37). Also, the magnetic nanocatalyst was reused five times with no loss in its activities.<sup>67</sup>

2.3.2. Synthesis and application of magnetic  $CuFe_2O_4$ @-starch. To obtain  $CuFe_2O_4$ @starch 122,  $Cu(NO_3)_2$  117 was reacted with  $Fe(NO_3)_3$  118 using sodium hydroxide in  $H_2O$  to give  $CuFe_2O_4$  nanoparticles 121, followed by reaction with starch to obtain  $CuFe_2O_4$ @starch 122. Its catalytic activity was tested in the synthesis of 4H-chromene 125 or 126 via the three-component reaction of various aldehydes 19, malononitrile 14, 2-hydroxy-1,4-naphthoquinone 123, or 4-hydroxycoumarin 124 (Scheme 38).<sup>68</sup>

In another attempt, 2-amino-5-oxo-5,6,7,8-tetrahydro-4H-benzo[b]pyrans 27 or 116 were synthesized via the reaction of aldehydes 19, malononitrile 14, and enolizable C–H-activated acidic compounds, including dimedone 64 and ethyl acetoacetate 21, in the presence of CuFe<sub>2</sub>O<sub>4</sub>@starch 122 as a Lewis acid in EtOH. The reaction rate for aldehydes with electron-withdrawing groups was faster than that with electron-donating groups (Scheme 39 and 40), respectively. This catalyst was used in six runs without a decrease in its activity.  $^{68}$ 

2.3.3. Synthesis and application of magnetic starch/SPION@SO<sub>3</sub>H. Superparamagnetic iron oxide nanoparticles (SPION) 127 were synthesized *via* the reaction of Fe<sup>2+</sup>, Fe<sup>3+</sup>, and ammonia in aqueous media. Then, SPION 127 was coated with

Scheme 15 Synthesis of Fe<sub>3</sub>O<sub>4</sub>@NFC@ONSM-Ni(II).

tetraethyl orthosilicate (TEOS) to give SPION@SiO<sub>2</sub> **128**, which was reacted with starch **110** to give magnetic starch, followed by reaction with allyltrimethoxysilane **130** to prepare allylfunctionalized magnetic starch **131**. Finally, starch/SPION@SO<sub>3</sub>H **133** was synthesized *via* the polymerization of

allyl-functionalized magnetic starch 131 and 4-styrenesulfonic acid 132 (Scheme 41). $^{69}$ 

Starch/SPION@SO<sub>3</sub>H **133** as a Brønsted acid (SO<sub>3</sub>H) activated the carbonyl groups in the multicomponent reaction of 4-hydroxycoumarin **124**, benzaldehydes **19**, dimedone **64**, and

ammonium acetate **71** in the synthesis of chromeno[4,3-*b*] quinoline-6,8(9*H*)-dione derivatives **134** (Scheme 42). This catalyst was applied ten times without any loss in its activity.<sup>69</sup>

2.3.4. Synthesis and application of magnetic Fe<sub>3</sub>O<sub>4</sub>@-GOTfOH/Ag/St-PEG-AcA. Initially, through the Hummers' method, graphite 135 was treated with  $H_2SO_4$ , KMnO<sub>4</sub>, and  $H_2O$  to give GO 136, which was treated with FeCl<sub>3</sub>, FeCl<sub>2</sub>, and ammonium solution at 80 °C to achieve Fe<sub>3</sub>O<sub>4</sub>@GO 137, followed by reaction with trifluoro methanesulfonic acid in  $CH_2CH_2$  to give Fe<sub>3</sub>O<sub>4</sub>@GOTfOH 138. In the next step, starch 139 was dissolved in water at 80 °C. Subsequently,  $N_1N_2$ 

R= H, 4-NO2, 4-N(Me)<sub>2</sub>, 2,4-Cl<sub>2</sub>, 2-OH, 4-OH, 4-Me, 4-OMe, 4-Cl, 3-Br, 3-NO<sub>2</sub>, 4-Br, 2-C

Scheme 19 Synthesis of pyrazolo quinolones 82 in the presence of Cell-LA-TEA $^+$ /Fe $_3$ O $_4$ .

methylene acrylene acrylamide (MBA) 140 was dissolved in water. Then, the above-mentioned two mixtures were mixed to obtain a homogeneous viscous mixture. Then, a certain amount of acrylic acid 141 and PEG-poly 142 was added to the reaction mixture. Then, ammonium persulfate (APS) 143 solution was added to the reaction mixture until a hydrogel was obtained. The above-mentioned homogeneous solution, AgNP 144 colloidal solution and Fe<sub>3</sub>O<sub>4</sub>@GOTfOH 138 were mixed to obtain Fe<sub>3</sub>O<sub>4</sub>@GOTfOH/Ag/St-PEG-AcA 146 (Scheme 43).  $^{70}$ 

The catalytic activity of Fe<sub>3</sub>O<sub>4</sub>@GOTfOH/Ag/St-PEG-AcA **146** was examined in the synthesis of 2,4,6-triarylpyridines **137** through the pseudo-three-component reaction of aryl aldehydes **19**, acetophenone **147** and ammonium acetate **71** (Scheme 44). According to the catalyst structure, the carbonyl groups were activated  $\nu ia$  interaction with the Brønsted acid site and Lewis acid of Fe<sup>3+</sup>. Also, the catalytic activity of **146** did not decrease after 10 runs.<sup>70</sup>

2.3.5. Synthesis and application of magnetic  $\gamma$ -Fe<sub>2</sub>O<sub>3</sub>@-starch-n-butyl SO<sub>3</sub>H. Fe<sub>3</sub>O<sub>4</sub> nanoparticles 4 were synthesized *via* the reaction of FeCl<sub>2</sub>·4H<sub>2</sub>O 2 and FeCl<sub>3</sub>·6H<sub>2</sub>O 1 and NH<sub>4</sub>OH solution in H<sub>2</sub>O an under argon atmosphere at room

aldehydes **19**, dimedone **64**, and 2-aminobenzimidazole **153** or phthalhydrazide **154** to synthesize tetrahydrobenzimidazo[2,1-b]quinazolin-1(2H)-ones **155** or 2H-indazolo[2,1-b]phthalazinetrione **156** (Scheme 46). This catalyst was used seven times without loss in any of its activities.<sup>71</sup>

#### 2.4. Magnetic bio-polymers based on alginate

2.4.1. Synthesis and application of  $Fe_3O_4$  and Alga CPTMS arg. Alginate 157 was immobilized on  $Fe_3O_4$  4 via

the co-precipitation method. Initially,  $FeCl_3 \cdot 6H_2O$  **1**,  $FeCl_2 \cdot 4H_2O$  **2**, and sodium alginate **157** were dissolved in  $H_2O$  under a nitrogen atmosphere. Then, an ammonia solution was added to this mixture to give  $Fe_3O_4$ @Alg nanoparticles **158**, which were functionalized with 3-chloropropyltrimethoxysilane **55** to prepare  $Fe_3O_4$ @Alg@CPTMS **159**, followed by reaction with *L*-arginin **160** using trimethylamine in EtOH for 48 h to give  $Fe_3O_4$ @Alg@CPTMS@Arg **161** (Scheme 47).<sup>72</sup>

**Scheme 33** Synthesis of dihydropyrano[2,3-c]pyrazoles **29** using magnetized dextrin.

Subsequently, Fe $_3$ O $_4$ @Alg@CPTMS@Arg, which has two acidic and basic functional sites, activated the carbonyl groups in the synthesis of 2,4,5-triarylimidazoles through the reaction of ammonium acetate, aldehydes, and benzil in EtOH under reflux conditions (Scheme 48). The recyclability of the catalyst

was tested 7 times using the model reaction without loss in any of its activities. When  ${\rm Fe_3O_4}$  was used as the catalyst, the yield of this reaction was about 65%. 72

**2.4.2.** Synthesis and application of Fe $_3$ O $_4$ @-Alg@CPTMS@Arg. The reaction of Fe $_3$ O $_4$ @Alg 165 and 3-chloropropyltrimethoxysilane (CPTMS) 55 in toluene under reflux conditions and nitrogen atmosphere gave Fe $_3$ O $_4$ @-Alg@CPTMS 166, which was reacted with arginine 167 in the presence of trimethylamine in dry toluene to provide Fe $_3$ O $_4$ @-Alg@CPTMS@Arg nanocomposites 168 (Scheme 49).

The activity of Fe<sub>3</sub>O<sub>4</sub>@Alg@CPTMS@Arg was tested as a catalyst in the synthesis of 2,4,5-triarylimidazoles  $36\ via$  the reaction of ammonium acetate 71, aldehyde derivatives 19, and benzil 34 in EtOH (Scheme 50). Its catalytic activity did not decrease after seven uses. It has two functional groups including a Lewis base (NH<sub>2</sub>) and Brønsted acidic (COOH), which catalyzed the synthesis of 2,4,5-triarylimidazoles.<sup>73</sup>

2.4.3. Synthesis and application of Fe<sub>3</sub>O<sub>4</sub>@FU. Fe<sub>3</sub>O<sub>4</sub>@FU 170 was prepared *via* the reaction of fucoidan powder 169,

Scheme 34 Synthesis of FND-Ti(IV) 109.

The activity of Fe $_3$ O $_4$ @FU was evaluated as a catalyst in the synthesis of tri- and tetra-substituted imidazoles  $\bf 36$  or  $\bf 171$  via three- and four-component reactions of benzil  $\bf 34$ , aldehydes  $\bf 19$ , NH $_4$ OAc  $\bf 71$ , and amine  $\bf 52$  under reflux conditions in EtOH (Scheme  $\bf 52$ ), respectively. The catalyst was used six times in the model reaction without loss in any of its activities. This reaction was accomplished in ethanol under reflux conditions in the presence of Fe $_3$ O $_4$  as a catalyst after  $\bf 40$  min with  $\bf 55\%$  yield. The carbonyl groups were activated via hydrogen bonding with Fe $_3$ O $_4$ @FU as a catalyst. $^{74}$ 

#### 2.5. Magnetic bio-polymers based on glucose

2.5.1. Synthesis and application of Fe $_3$ O $_4$ @C@ONa. Initially, FeCl $_3$ -6H $_2$ O solution, CO(NH $_2$ ) $_2$ , and glucose were added to ethylene glycol 172 to produce a black powder of carbon-coated magnetic nanoparticles (CCMNPs: Fe $_3$ O $_4$ @C) 173, followed by reaction with NaOH solution to obtain basic carbon-coated magnetic nanoparticles (BCCMNPs: Fe $_3$ O $_4$ @-C@ONa) 174 (Scheme 53).75

Subsequently, the catalytic activity of Fe<sub>3</sub>O<sub>4</sub>@C@ONa was tested for the synthesis of 4*H*-chromene derivatives **174** *via* the reaction of salicylaldehyde **42**, dimedone **64**, and  $\beta$ -naphthol **101** in water at 60 °C (Scheme 54). Also, the catalyst was used five times in the model reaction without loss in any of its

2.6.3. Synthesis and application of magnetic chitosanterephthaloyl-creatine bio-nanocomposite. The reaction of terephthaloyl chloride 183 and creatine powders 184 in CH<sub>2</sub>Cl<sub>2</sub> under reflux conditions provided creatine-terephthaloyl chloride ligand 185, which was added to chitosan 176 powder in a hydrochloric acid solution, and then refluxed to give chitosanterephthaloyl-creatine bio-nanocomposite 186, followed by immobilization on Fe<sub>3</sub>O<sub>4</sub> to provide magnetic chitosanterephthaloyl-creatine bio-nanocomposite 187 (Scheme 59).78

Its catalytic activity was tested in the synthesis of polyhydroquinolines 72 via the reaction of aldehydes 19, dimedone 67, ammonium acetate 71, and ethyl acetoacetate or methyl acetoacetate 21 in EtOH (Scheme 60). In another attempt, it was

used in the synthesis of 1,4-dihydropyridines 73 via the pseudothree-component reaction of aldehydes 19, methyl acetoacetate 21, and ammonium acetate 71 (Scheme 61). The acidic site of the catalyst activated the carbonyl groups of the primary compounds. The activity of this catalyst did not decrease after use eight times.78

2.6.4. Synthesis and application of magnetic cyanoguanidine-modified chitosan (MCGC). Firstly, chitosan 176 was obtained via the deacetylation of chitin 74, and then it was modified by treatment with cyanoguanidine 188 in HCl solution to produce cyanoguanidine-modified chitosan (CGC) 189, which was immobilized on Fe<sub>3</sub>O<sub>4</sub> nanoparticles to afford magnetic cyanoguanidine-modified chitosan (MCGC) 190 (Scheme 62). Its catalytic activity was investigated in the synthesis of benzimidazologuinazolines 155 via the reaction of aldehydes 19, 2-aminobenzimidazole 153, and dimedone 64 in EtOH under reflux conditions. The sonochemical method afforded better yields in shorter reaction times than the conventional method (Scheme 63).79

1,4-Dihydropyridines 73 were synthesized *via* the Hantzsch reaction of ethyl acetoacetate 35, aromatic aldehydes 19, and ammonium acetate 71 under ultrasonic irradiation in the presence of MCGC 190 as a catalyst, which activated the carbonyl groups via hydrogen bonding. Also, the yield of the reaction did not decrease after eight times usage of the catalyst (Scheme 64).79

triones **194** *via* the multicomponent reaction of dimedone **64**, aldehydes **19**, and acenaphthoquinone **193** under ultrasonic irradiation in  $H_2O$  (Scheme 66). Also,  $MnFe_2O_4$ -CS-Bu-SO<sub>3</sub>H as a Brønsted acid increased the reaction rate *via* hydrogen bonding with the carbonyl group. According to the reusability test, this catalyst was used five times without any loss in its activity.<sup>80</sup>

**2.6.6.** Synthesis and application of magnetic Cu-MCS. Fe<sub>3</sub>O<sub>4</sub> NPs 4 were reacted with carboxymethylated chitosan to obtain magnetic chitosan MCS **195**, which was reacted with

 $CuCl_2 \cdot 2H_2O$  in  $H_2O$  to generate Cu NPs@Fe<sub>3</sub>O<sub>4</sub>-chitosan (CuMCS) **196** (Scheme 67).

178

The catalytic activity of Cu-MCS was verified in the synthesis of various tetrazoles **198** or **199** via the reaction of cyanamides **197** and NaN<sub>3</sub> **50** in H<sub>2</sub>O under reflux conditions (Scheme 68). This catalyst could be used five times without loss in its activity.<sup>81</sup>

2.6.7. Synthesis and application of magnetic Ch-Fe<sub>3</sub>O<sub>4</sub> NCs. Chitosan was dissolved in an acetic acid solution, and then  $FeCl_3 \cdot 6H_2O$  1 and  $FeCl_2 \cdot 4H_2O$  2 were added to the reaction mixture for 6 h at 80 °C under an N<sub>2</sub> atmosphere. Then, NH<sub>4</sub>OH

**RSC Advances** Review

#### 2.8. Synthesis and application of magnetic Fe<sub>3</sub>O<sub>4</sub>(a)xanthan gum

NH<sub>4</sub>OH solution was added to a mixture of the FeCl<sub>2</sub>·4H<sub>2</sub>O,  $FeCl_3 \cdot 6H_2O(1:2)$ , and an aqueous suspension of xanthan gum 213 to give Fe<sub>3</sub>O<sub>4</sub>@xanthan gum 214 (Scheme 75).85

Fe<sub>3</sub>O<sub>4</sub>@xanthan gum was applied in the synthesis of 2amino-3-cyano-4H-pyran derivatives 116 via the reaction of aldehydes 19, dimedone 64, and malononitrile 14 in EtOH (Scheme 76). The model reaction was performed about nine times and the yields did not decrease. This reaction was accomplished in the presence of Fe<sub>3</sub>O<sub>4</sub> after 45 min in 30% yield. It was shown that Fe<sub>3</sub>O<sub>4</sub>@xanthan gum activated the carbonyl groups via hydrogen bonding, which was more effective than Fe<sub>3</sub>O<sub>4</sub>.85

#### Conclusion

Many bio-polymers can be obtained from natural sources. According to the importance of green chemistry in organic reactions, in this review, the application of bio-polymers as a catalyst in multicomponent reactions was grouped and summarized. Herein, we highlighted the immobilization of magnetic nanoparticles with bio-polymers. Due to the excellent properties of magnetic nano-catalysts, including their non-toxic nature, high surface area, simple preparation, easy surface modification, and simple separation, these systems have been applied as catalysts in multicomponent reactions. Various organic compounds such as bio-polymers were used for the modification of magnetic nanoparticles. Bio-polymers have various advantages such as biodegradable, biocompatible, and heat-resistant nature. Therefore, herein, their synthesis and catalytic activities in multicomponent reactions were studied. We believe that this article will guide researchers in the design and synthesis of various compounds according to green chemistry. Magnetic nanocomposites have many applications in various fields including, drug delivery, solar cells, chemical sensors, water treatment, biomedical sensors, and catalysts. The importance of these topics could be discussed as a review article in the future.
