## Scalemic myrionsumamide A, tetracyclic skeleton alkaloids from *Myrioneuron effusum*†

Jia-Hui Zhang,<sup>‡,ac</sup> Mingming Cao,<sup>‡,a</sup> Yu Zhang,<sup>a</sup> Xiao-Hui Li,<sup>ad</sup> Yu-Cheng Gu,<sup>Id</sup><sup>e</sup> Xiao-Nian Li,<sup>a</sup> Ying-Tong Di,<sup>Id</sup><sup>\*a</sup> and Xiao-Jiang Hao,<sup>Id</sup><sup>\*abc</sup>

Investigation of the alkaloids from *Myrioneuron effusum* leads to the isolation of myrionsumamide A (**1**), a pair of enantiomeric alkaloids with an unprecedented tetracyclic system skeleton. These two alkaloids were separated by chiral HPLC with a ratio of 3 : 5 from the scalemic mixture. Their structures including absolute configurations were determined by NMR spectroscopy, X-ray diffraction data and ECD calculations. Both (+)-**1** and (−)-**1** showed antibacterial activity against *Staphylococcus aureus* with MIC at 7.81 µg ml<sup>−1</sup>.

## Introduction

*Myrioneuron* alkaloids belong to the category of lysine-based structurally diverse natural products elaborated by plants of the genus *Myrioneuron* R. Br. (Rubiaceae).<sup>1</sup> Some structures of them showed significant biological activities such as antimalarial and anti-hepatitis C virus (HCV),<sup>2–4</sup> which along with their complex ring systems (up to 10 hexatomic rings) and amazing multiple chiral centers (up to 12 ones) within one structure have attracted great attention for total synthesis studies.<sup>5–7</sup> By July 2022, more than twenty *Myrioneuron* alkaloids had been obtained with various polycyclic structures (tricyclic-, tetracyclic-, pentacyclic-, hexacyclic-, octacyclic-, and decacyclic-type).<sup>1,4,8–10</sup> However, their stereochemistry control and polycyclic skeleton construction logic in nature remain elusive.

One basic feature of *Myrioneuron* alkaloids is their decahydroquinoline (DHQ) core (Fig. 1), and the subsequent attachment of rings C and D onto the DHQ moiety (rings A and B) consistently generated the typical ‘myrionamide carbon skeleton’ with a series of chiral centers (Fig. 1). From the

biosynthesis perspective, the five carbon atoms on ring D were assumed to be derived from a lysine after oxidation and decarboxylation reactions.<sup>2,8</sup> However, in our continuous investigation of bioactive *Myrioneuron* alkaloids, (±)-myrionsumamide A (**1**) was isolated and possessed a different carbon skeleton from myrionamide and schoberine (Fig. 2), whose structures were confirmed by X-ray diffraction experiments.<sup>3</sup> This new manner of ring D formation and attachment drew our attention to study its structure and bioactivity.

Here we report the isolation of **1** from *Myrioneuron effusum* (Pitard) Li and its structural elucidation on the basis of NMR and X-ray diffraction data analysis, and a hypothesized biogenetic pathway of **1** was also discussed. Further we observed that myrionsumamide A is a scalemic mixture, and (+)-**1** and (−)-**1**

were separated by chiral HPLC with a ratio of 5 : 3. An anti-bacterial experiment showed both (+)-**1** and (−)-**1** were active against *Staphylococcus aureus* with MIC at 7.81  $\mu\text{g ml}^{-1}$ .

## Results and discussion

Myrionsumamide A (**1**) was recrystallized from acetone to give colorless crystal, and its molecular formula  $\text{C}_{15}\text{H}_{24}\text{N}_2\text{O}_2$  was established by positive HR-ESI-MS ( $m/z$  265.1922 [ $\text{M} + \text{H}$ ] $^+$ , calcd for  $\text{C}_{15}\text{H}_{25}\text{N}_2\text{O}_2$ , 265.1911), corresponding to 5 degrees of unsaturation. The  $^1\text{H}$  and  $^{13}\text{C}$  NMR data (Table 1) revealed the presence of two quaternary carbons ( $\delta_{\text{C}}$  174.0 and  $\delta_{\text{C}}$  70.7), four methines, and nine methylenes. The IR absorption bands around 3555, 2932 and 1614  $\text{cm}^{-1}$  showed the presence of hydroxyl, secondary amine, and carbonyl functionality, respectively. Since one carbonyl accounted for one out of the five degrees of unsaturation, the remaining four degrees of unsaturation were assumed for the presence of a tetracyclic system in the structure.

The gross structure of **1** was constructed by 2D NMR experiment. Based on the  $^1\text{H}$ - $^1\text{H}$  COSY and HSQC study, two structural fragments were established as drawn with bold bonds (Fig. 3A). The connectivity of the two structural fragments, *via*

two nitrogen atoms and two quaternary carbons were established by the analysis of HMBC correlations (Fig. 3A). The HMBC correlation from H-2 to C-10 indicated that C-2 and C-10 were connected *via* N-1, which further confirmed by that methine ( $\delta_{\text{C}}$  174.0,  $\delta_{\text{C}}$  54.5) and methylene ( $\delta_{\text{C}}$  2.2,  $\delta_{\text{C}}$  42.5) were typical carbons bearing one nitrogen atom of *Myrioneuron* alkaloid. Similarly, the HMBC correlations from H-11 to C-13 and from H-13 to C-11 revealed that C-11 and C-13 were connected through N-12. In addition, the HMBC correlations from H-9, H-11 and H-15 to C-16, from H-2, H-11 and H-15 to C-17, from H-11 to C-15 and from H-15 to C-11 indicated the structural fragments **a** and **b** were connected by a quaternary carbon bridge of C-16/C-17. Thus, the 2D structure of **1** was established as shown (Fig. 3A).

The relative configuration of **1** was elucidated by  $^2J$  coupling constant analysis and further confirmed by X-ray diffraction data. Since H-10 was split by H-5 and H-9 to give  $^2J = 5.52$  Hz which required *cis* position of both H-5 and H-9 with H-10, and these three cofacial protons were arbitrarily assigned as  $\beta$ -oriented. The remaining chiral centers at C-11 and C-16 were directly confirmed by X-ray diffraction. Compound **1** was carefully recrystallized from acetone. As a result, the planar structure and relative configuration of **1** was confirmed as shown in Fig. 3B. Moreover, analysis of X-ray data suggested **1** to be racemate by the space group  $P\bar{1}$  (data has been deposited to CCDC with no. 2190231). Subsequently, **1** was further analyzed by HPLC with a chiral column and turned out to be an scalemic

Fig. 4 Analysis of a scalemic mixture of (±)-**1** by chiral HPLC (Daicel Chiralpak IC 4.6  $\times$  250 mm).

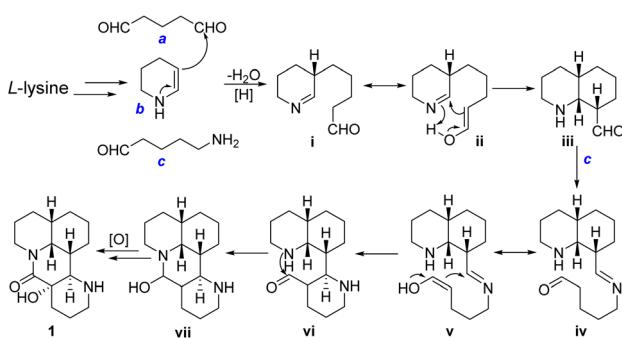

mixture with a ratio of  $(+)-1/(-)-1$  as 5 : 3 (Fig. 4), and in agree with its slightly positive rotation value (Fig. S1.10†).

Both racemic and enantiomeric enrichment were observed in alkaloids from *Myrioneuron faberi*,<sup>3</sup> so we suppose that primary polycyclic structures could be formed spontaneously as biomimetic access to  $C_5$ -lysine-derived nitraramine<sup>11</sup> and other scalemic natural products,<sup>12,13</sup> while the optical pure species should be resulted from late stage enzymatic modification(s). A proposed biosynthetic pathway for **1** starting from *L*-lysine was shown in Scheme 1. Three basic building bricks **a**, **b** and **c** could be derived from *L*-lysine through decarboxylation, deamination, and oxidation, with disappearance of the chiral carbon. First, **a** and **b** could transform into intermediates **i** and **ii** via Mannich-like reaction. Second, **iii** could react with **c** to give imine **iv**, and the tautomer of **iv** might undergo intramolecular Mannish-like reaction resulting ring D closed **vi**. Then ring C could be generated to give **vii** via condensation from **vi**. Finally, **1** could be obtained by oxidation of **vii**. Since optical monomer  $(+)-1$  was enriched over  $(-)-1$ , it was speculated that the hydroxylation at C-16 was catalyzed by an oxygenase with poor stereoselectivity which favors the formation of  $(+)-1$ .

Based on the relative configurations, the absolute configurations of the two enantiomers were confirmed by comparing the experimental CD with the theoretical calculation ECD (Fig. 5). The ECD spectrum was calculated using the TD-DFT-B3LYP/6-311G+(2d,p) theory of B3LYP/6-31G(d,p)-optimized geometries with the IEFPCM model (in MeOH) in the Gaussian 09 program package.<sup>14</sup> The CD of  $(+)-1$  is in agree with the ECD of the model compound (5*R*, 9*S*, 10*S*, 11*S*, 16*R*), while the CD of  $(-)-1$  is comparable to the ECD of (5*S*, 9*R*, 10*R*, 11*R*, 16*S*) (Fig. 5). Thus, the absolute configuration of  $(+)-1$  and  $(-)-1$  was determined as 5*R*, 9*S*, 10*S*, 11*S*, 16*R* and 5*S*, 9*R*, 10*R*, 11*R*, 16*S*, respectively.

Antibacterial activity of  $(+)-1$  and  $(-)-1$  were evaluated against six bacterial strains (*Staphylococcus aureus* ATCC29213, *Bacillus subtilis* ATCC 6051, *Escherichia coli* ATCC25922, *Pseudomonas aeruginosa* ATCC27853, *Acinetobacter baumanii* ATCC BAA-1710D and *Klebsiella pneumonia* ATCC BAA-1705) by MIC method<sup>15</sup> after optical density value by spectrophotometer at 490 nm. Both  $(+)-1$  and  $(-)-1$  showed antibacterial activity against *Staphylococcus aureus* ATCC29213 with MIC value of 7.81  $\mu$ g ml<sup>-1</sup>.

## Experimental

### General procedures

Optical rotations were measured with a Jasco P-1020 polarimeter. UV spectra were obtained using a Shimadzu UV-2401A spectrophotometer. A Tenor 27 spectrophotometer was used for IR spectra as KBr pellets. 1D and 2D NMR spectra were recorded on Bruker spectrometer with TMS as internal standard. HRESIMS was performed on a triple quadrupole mass spectrometer. Semi-preparative HPLC was performed on an Agilent 1100 liquid chromatograph with a Waters X-Bridge Prep Shield RP18 (10 × 150 mm) column. Column chromatography (CC) was performed using silica gel (100–200 mesh and 300–400 mesh, Qingdao Marine Chemical, Inc., Qingdao, People's Republic of China) and Sephadex LH-20 (40–70  $\mu$ m, Amersham Pharmacia Biotech AB, Uppsala, Sweden). Microplate reader (BioTek ELx800) was used in antibacterial assay. X-ray diffraction was carried out on BRUKER D8 QUEST.

### Plant material

The twigs and stems of *Myrioneuron effusum* were collected from Guangxi Province, People's Republic of China, in November 2014. The plant samples were identified by Ligong Lei of Kunming Institute of Botany, Chinese Academy of Science (CAS). A voucher specimen (HJ20141101) was deposited at the State Key Laboratory of Phytochemistry and Plant Resource in West China, Kunming Institute of Botany, Chinese Academy of Science (CAS).

### Extraction and isolation

The air-dried, powdered leaves and twigs (57 kg) of *M. effusum* were extracted three times with MeOH at room temperature. The total extract (4.8 kg) was subjected to normal phase Si gel (100–200 mesh; CHCl<sub>3</sub>/MeOH, 1 : 0 to 0 : 1) to obtain four major fractions (Fr. 1–4). Fraction 2 (311.5 g) was also subjected to Si gel column chromatography with CHCl<sub>3</sub>/MeOH (20 : 1) to yield four sub-fractions (2a–2d). Fraction 2c (90.0 g) was chromatographed over a RP-C18 silica gel with step-gradient of MeOH-H<sub>2</sub>O (v/v, from 10 : 90 to 90 : 10) to obtain the crude alkaloids

(51.4 g) and then separated to three fractions (2c-1-2c-3) by Si gel column chromatography (300–400 mesh,  $\text{CHCl}_3/\text{MeOH}$ , 20 : 1). Fraction 2c-1 (12.6 g) was separated by preparative HPLC (Waters XSelect CSH prep C18, 5  $\mu\text{m}$ , 19  $\times$  150 mm;  $\text{MeOH-H}_2\text{O}$ , from 30 : 70 to 90 : 10 in 20 min; velocity of flow 10 ml min $^{-1}$ ) to obtain three fractions (2c-1a–2c-1c). Fraction 2c-1b (40.5 mg) was chromatographed over a Sephadex LH-20 gel column to give compound ( $\pm$ )-1 (15.6 mg). Then (+)-1 and (–)-1 were separated by chiral HPLC (Daicel Chiralpak ODH, 4.6  $\times$  250 mm, isopropanol/hexane 13 : 87, 1 ml min $^{-1}$ ).

### X-ray crystallographic analysis

The crystals of **1** were obtained from acetone at room temperature. The crystallographic diffraction data were collected with  $\text{Cu K}\alpha$  radiation ( $\lambda = 1.54178 \text{ \AA}$ ) using a BRUKER D8 QUEST diffractometer at  $T = 150(2)$  K. The structure was solved by the SHELXS method and refined based on full-matrix least-squares on  $F^2$  using SHELXL-2018/3. Crystal data for **1**:  $\text{C}_{15}\text{H}_{24}\text{N}_2\text{O}_2$ ,  $M = 264.36$ ,  $a = 10.0436(5) \text{ \AA}$ ,  $b = 11.4268(6) \text{ \AA}$ ,  $c = 12.7535(6) \text{ \AA}$ ,  $\alpha = 92.7820(10)^\circ$ ,  $\beta = 96.8930(10)^\circ$ ,  $\gamma = 108.4380(10)^\circ$ ,  $V = 1372.67(12) \text{ \AA}^3$ ,  $T = 100(2)$  K, space group  $P\bar{1}$ ,  $Z = 4$ ,  $\mu(\text{CuK}\alpha) = 0.676 \text{ mm}^{-1}$ , 17 390 reflections measured, 4629 independent reflections ( $R_{\text{int}} = 0.0477$ ). The final  $R_1$  values were 0.0744 ( $I > 2\sigma(I)$ ). The final  $wR(F^2)$  values were 0.2159 ( $I > 2\sigma(I)$ ). The final  $R_1$  values were 0.0747 (all data). The final  $wR(F^2)$  values were 0.2165 (all data). The goodness of fit on  $F^2$  was 1.107.

### Antibacterial assay

Compounds (+)-1 and (–)-1 were tested for antibacterial activities against *Staphylococcus aureus* ATCC29213, *Bacillus subtilis* ATCC 6051, *Escherichia coli* ATCC25922, *Pseudomonas aeruginosa* ATCC27853, *Acinetobacter baumanii* ATCC BAA-1710D and *Klebsiella pneumonia* ATCC BAA-1705. The minimum inhibitory concentration (MIC) values were determined using a 96-well plate format with LB broth. Briefly, each strain was grown in LB and used as a seed culture when the  $\text{OD}_{490}$  reached 2.0. The seed culture (10  $\mu\text{L}$ ) was added to 10 ml LB, and 100  $\mu\text{L}$  LB with cells was transferred into the first 6 columns on a 96-well plate ready for assay (LB without cells in column 7 as background, and DMSO instead of compound in column 8 as a negative control). The compounds (+)-1 and (–)-1 and the positive control hygromycin b were dissolved in DMSO to make serial dilutions ready for assay. Then add a series of compound to get final concentrations of 125  $\mu\text{M}$ , 62.5  $\mu\text{M}$ , 31.25  $\mu\text{M}$ , 15.62  $\mu\text{M}$ , 7.81  $\mu\text{M}$ , 3.91  $\mu\text{M}$  in each row. Each strain was also set up in the same way and in triplicate. The 96-well plates were cultured at 37 °C for 8 h and then the  $\text{OD}_{490}$  was measured to determine the MIC values.

## Conclusions

In this work we showed a new ring system construction manner together with stereoselectivity adopted by *Myrioneuron* alkaloids ( $\pm$ )-Myrionsumamide A. Their structures and absolute configurations were elucidated by NMR data analysis, X-ray

diffraction, and ECD calculations. Meanwhile, both (+)-1 and (–)-1 showed antibacterial activity against *Staphylococcus aureus*.
