Wet nitrocellulose membrane for the level 3 feature visualization of various latent fingerprints and gender determination

The diagram illustrates a workflow for the visualization of lifted LFPs from various surfaces. The process involves the use of an ink/NC membrane, which is then treated with ink, chitosan, and a nitrocellulose membrane. The resulting visualization shows the lifted LFPs from various surfaces, which can be identified and categorized by gender (male and female) and by the type of surface (e.g., paper, metal, plastic, wood, glass, fabric, etc.).

A near-infrared fluorescent probe for *in situ* imaging of SO₂ flux in drug-induced liver injury

Figure 1 illustrates the design and application of a SO_2 -responsive fluorescent probe. The probe is synthesized via the coupling of Fluorophore 1 and Fluorophore 2, forming a conjugate with a SO_2 site. The probe exhibits a fast response ($\lambda_{\text{max}} = 800 \text{ nm}$) to SO_2 . The probe is used for SO_2 detection in food samples, as demonstrated by the fluorescence intensity change in a mouse model (Probe vs. Probe+APAP) and the detection of SO_2 in various food samples (Beer, Bread, Bitter Melon, Garlic, Crystal, Tanger, Yuba, Raisins, Fungus, and Dried vegetables) using a colorimetric assay.
