Selenium-enriched peptides identified from selenium-enriched soybean protein hydrolysate: protective effects against heat damage in Caco-2 cells

In our investigation, selenium-enriched soy peptides (SePPs) were purified, yielding five distinct fractions. Fraction F3 exhibited superior antioxidant and anti-inflammatory attributes. Two prominent peptides, ESeCQIQKL (Sep-1) and SELRSPKSeC (Sep-2), identified within F3, mitigated heat stress-induced damages in Caco-2 cell models, notably oxidative stress and inflammation. Their protective mechanism involved modulation of critical proteins like Nrf2, Keap1, and NLRP3. Molecular studies demonstrated Sep-1's higher affinity towards Keap1. This research underscores the potential of Sep-1 and Sep-2 in dietary supplement formulations for heat-related ailment prevention.
