#### Abstract

Compounds containing benzimidazole moiety occupy privileged chemical space for discovering new bioactive substances. In continuation of our recent work, 69 benzimidazole derivatives were designed and synthesized with good to excellent yields of $46-99 \%$ using efficient synthesis protocol i.e. sodium metabisulfite catalyzed condensation of aromatic aldehydes with o-phenylenediamines to form 2arylbenzimidazole derivatives followed by $N$-alkylation by conventional heating or microwave irradiation for diversification. Potent antibacterial compounds against MSSA and MRSA were discovered such as benzimidazole compounds 3k (2-(4-nitrophenyl), $N$-benzyl), 31 (2-(4-chlorophenyl), $N$-(4-chlorobenzyl)), 4c (2-(4-chlorophenyl), 6-methyl, $N$-benzyl), 4g (2-(4-nitrophenyl), 6-methyl, $N$-benzyl), and 4j (2-(4nitrophenyl), 6-methyl, $N$-(4-chlorobenzyl)) with MIC of $4-16 \mu \mathrm{~mL}^{-1}$. In addition, compound 4 c showed good antimicrobial activities ( $\mathrm{MIC}=16 \mu \mathrm{~g} \mathrm{~mL}{ }^{-1}$ ) against the bacteria strains Escherichia coli and Streptococcus faecalis. Moreover, compounds $3 \mathrm{k}, 3 \mathrm{l}, 4 \mathrm{c}, 4 \mathrm{~g}$, and 4 j have been found to kill HepG2, MDA-MB-231, MCF7, RMS, and C26 cancer cells with low $\mu$ M IC 50 (2.39-10.95). These compounds showed comparable drug-like properties as ciprofloxacin, fluconazole, and paclitaxel in computational ADMET profiling. Finally, docking studies were used to assess potential protein targets responsible for their biological activities. Especially, we found that DHFR is a promising target both in silico and in vitro with compound 4 c having $\mathrm{IC}_{50}$ of $2.35 \mu \mathrm{M}$.

## 1. Introduction

Heterocyclic compounds, which are present in a large number of biologically active synthetic and natural substances including many drugs, are of interest to pharmaceutical chemists for designing new potential bioactive compounds with a wide range of biological activities. ${ }^{1,2}$ Benzimidazole is a naturally occurring bicyclic compound consisting of fused benzene and imidazole ring and is an integral part of the structure of vitamin $\mathrm{B}_{12}$. Moreover, benzimidazole derivatives have showed
anticancer, ${ }^{1,3-5}$ antimicrobial, ${ }^{4,6-8}$ anti-inflammation, ${ }^{9}$ antiviral, ${ }^{10}$ antihypertensive, ${ }^{11}$ antihistamine, ${ }^{12}$ antitubercular, ${ }^{13}$ antiulcer, ${ }^{14}$ analgesic,,${ }^{15}$ anthelmintic, ${ }^{16}$ antiprotozoal, ${ }^{17}$ antiamoebic, ${ }^{18}$ anticonvulsant, ${ }^{19}$ antiparasitic. ${ }^{20}$ In addition, benzimidazole scaffold presents in core structure of a vast list of important drugs such as antiulcer (omeprazole, lansoprazole, rabeprazole, pantoprazole), antihistamines (astemizole, clemizole, and emedastine), antihypertensives (telmisartan, candesartan, and azilsartan), anthelmintics (thiabendazole, parbendazole, mebendazole, albendazole, cambendazole, and

[^0][^1]

Fig. 1 Several drug compounds containing $1 H$-benzimidazole moiety.
flubendazole), antiviral (maribavir), antiparasitic (cyclobendazole, luxabendazole, and cambendazole), antidiabetic (rivoglitazone), analgesic (clonitrazene), especially antifungal (systemic fungicide, e.g. benomyl) and anticancer (antimitotic agent, e.g. nocodazole, PARP inhibitor, e.g. veliparib). ${ }^{21}$ Furthermore, the potency of drugs like carbendazim, ${ }^{22}$ and dovitinib containing benzimidazole moiety has been recognized against various types of cancer cell lines (Fig. 1). ${ }^{23}$

1 H -Benzimidazole structures with different substituents at positions C-2 and C-5/6 can be synthesized by different methods. However, the most efficient syntheses are the condensation of $o$-phenylenediamines with carboxylic acids (or their derivatives such as nitriles, chlorides, and orthoesters) in the presence of an acid or with aldehydes using sodium metabisulfite $\left.\left(\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{5}\right)\right)^{1,5}$ In addition, $\mathrm{N}-1$ substituent $1 H$-benzimidazole derivatives can be introduced by $N$-alkylation with substituted halides in the presence of a base. ${ }^{24}$ Our study highlights the use of the green and environmentally-friendly chemical method as using microwaves in the whole synthesis process of 1 H -benzimidazole derivatives.

Rationale and structure-based design of new antimicrobial and anticancer agents: Structure-activity relationship studies of the benzimidazole ring system suggested that the $\mathrm{N}-1, \mathrm{C}-2$, and $\mathrm{C}-6$ positions are important for biological activities. ${ }^{25,26}$ Especially, the $\mathrm{N}-1$ position can increase anticancer activity when attached to different substituents, for example, benzyl groups similar to clemizole and candesartan drugs. As part of our ongoing research, we were interested in designing $N$-substituted benzimidazoles which were presented in many biologically active compounds. ${ }^{24,27}$ Our designed derivatives and Dovitinib anticancer drug, Benomyl antifungal drug, and antibacterial

Fig. 2 Rational study design of N,2,6-trisubstituted 1H-benzimidazole derivatives (MIC - minimal inhibitory concentration).
derivatives of Dokla et al., 2020 (MIC on E. coli strain of $2 \mu \mathrm{~g}$ $\mathrm{mL}^{-1}$ ) share three common essential structural features: a planar benzimidazole moiety, C-2 aromatic substitution, and $\mathrm{N}-1$ substitution. ${ }^{28}$ Moreover, the C-6 position with different substituents such as -H and $-\mathrm{CH}_{3}$ were designed in order to examine their effects on antimicrobial and anticancer activities (Fig. 2).

Mechanistically, one pharmacological activity can be linked to one or more different receptors. ${ }^{2,29}$ A receptor may also be involved in different biological activities. Furthermore, the mechanism of action on the cell membrane and the inhibition of important enzymes present in both microbial and cancer cells may confer dual antibacterial, antifungal, and antitumor effects. A good example is dihydrofolate reductase (DHFR) which is a potential receptor for both antitumor and antimicrobial activities. ${ }^{21,30}$ This could be due to the similarity of DHFR from bacteria, fungi, and the cancer cell line. Therefore, the in silico studies were the potential approach to confirm the ligand-target interaction in many different receptors. In recent years there has been significant progress to improve the receptor flexibility in docking, ${ }^{31-33}$ in silico studies are able to rank the compound potency or precisely predict the target after having experimental in vitro results.

The development of antibiotic resistance in microorganisms, as well as cancer resistance, has resulted in research and development in search of new antibiotics and anticancer drugs to maintain an effective drug supply at all times. It is important to find out newer, safer, and more effective antibiotics and
anticancer drugs with multiple effects, especially showing good anticancer and anti-microbial activities. This is very beneficial for cancer patients due to their weakened immunity and susceptibility to microbial attack. Therefore, the purpose of this study is to synthesize novel $N, 2,6$-trisubstituted $1 H$-benzimidazole derivatives with various substituents at positions $\mathrm{N}-1, \mathrm{C}-2$, and C-6 and evaluation of their antibacterial, antifungal, and anticancer activities in continuation of our recent study. ${ }^{4}$

## 2. Results and discussion

### 2.1. Chemistry

The benzene-1,2-diamine derivatives with a $4-\mathrm{H}$ or $4-\mathrm{CH}_{3}$ group are the starting material for the preparation of $N, 2,6$-trisubstituted $1 H$-benzimidazole derivatives. The process of synthetic research consists of two steps (Scheme 1). Firstly, a series of 2,6disubstituted 1 H -benzimidazole derivatives ( $\mathbf{1 a - 1 \mathbf { w }}$ and $\mathbf{2 a}-\mathbf{2 w}$ ) have been synthesized by condensing benzene-1,2-diamine derivatives with substituted aromatic aldehydes using conventional heating and microwave-assisted methods. Forty-six derivatives have been synthesized in good to excellent yields with the reflux method ( 75 to $93 \%$ ) and excellent yields with the microwave-assisted method ( 90 to $99 \%$ ). The reaction time has been dramatically reduced, as using conventional heating the reaction is carried out in $6-12 \mathrm{~h}$ compared with $10-15 \mathrm{~min}$ heating in the microwave. In addition, the reaction yield has increased ranging between 6 to $17 \%$ with microwave assistance (Table 1). Secondly, a series of $N, 2,6$-trisubstituted $1 H$-benzimidazole derivatives ( $\mathbf{3 a - 3 l}$ and $\mathbf{4 a}-\mathbf{4 k}$ ) have been synthesized by reacting 2,6 -disubstituted $1 H$-benzimidazole derivatives with substituted halides using conventional heating and microwaveassisted methods. Compounds 3a-3l showed about 2 times higher yields than compounds $\mathbf{4 a} \mathbf{- 4 k}$. Twenty-three derivatives have been synthesized in moderate to good yields with the reflux method ( 35 to $86 \%$ ) and moderate to excellent yields with the microwave-assisted method ( 46 to $98 \%$ ). The reaction time also has been dramatically reduced, as using conventional heating the reaction is carried out in $12-24 \mathrm{~h}$ compared with $20-$ 60 min heating in the microwave. Furthermore, the reaction

Scheme 1 Synthesis of N,2,6-trisubstituted 1 H -benzimidazole derivatives (MW: microwave irradiation, EtOH: ethanol).
yield has increased ranging between 3 to $20 \%$ with microwave assistance (Table 2). The synthesized compounds possess physical-chemical properties of fragments (M. Wt around 250) or lead-like (M. Wt around 350) that follow Lipinski's rules which is an excellent starting point for further development. ${ }^{34,35}$ Especially, sixteen derivatives ( $\mathbf{3 b} \mathbf{b} \mathbf{3 d}, \mathbf{3 g}, \mathbf{3 j}$, and $\mathbf{4 a}-\mathbf{4 k}$ ) are new compounds.

Structures of synthesized compounds were assigned using IR, ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, and mass spectroscopies. In IR spectra, the medium absorbance band of the aromatic ring ( $\nu 1520-$ $1395 \mathrm{~cm}^{-1}$ region), as well as a strong absorbance band of imine $(\mathrm{C}=\mathrm{N})$ of imidazole nucleus of 1 H -benzimidazole derivatives ( $\nu$ $1650-1510 \mathrm{~cm}^{-1}$ region), were observed. In addition, in ${ }^{1} \mathrm{H}$ NMR spectra of compounds 1 and 2 in DMSO characteristic chemical shifts of NH protons of $1 H$-benzimidazole (singlet in the $\delta 13.35-12.30 \mathrm{ppm}$ region) and aromatic protons (in the $\delta 9.35-$ 6.70 ppm region) were observed. On the other hand, ${ }^{1} \mathrm{H}$ NMR spectra of compounds 3 and 4 revealed the appearance of a singlet in the $5.80-4.85 \mathrm{ppm}$ region of the $-\mathrm{CH}_{2}-\mathrm{CH}=\mathrm{CH}_{2}$ or -$\mathrm{CH}_{2}-\mathrm{Ar}$ group. Furthermore, the $\mathrm{C}=\mathrm{N}$ group ( $\delta 153.5-142.5$ ppm ) and the $-\mathrm{CH}_{2}-\mathrm{CH}=\mathrm{CH}_{2}$ or $-\mathrm{CH}_{2}-\mathrm{Ar}$ group ( $\delta 48.0-45.5$ ppm ) were identified in the ${ }^{13} \mathrm{C}$ NMR spectrum of compounds 3 and 4. Finally, mass spectra showed the molecular ion peak $M$ $(\mathrm{m} / \mathrm{z})$ of compounds $\mathbf{1 - 4}$ which helped to confirm the hypothesized structure.

### 2.2. In vitro antibacterial and antifungal activities

Antimicrobial activities (exhibited by MIC values) including antibacterial activities against two strains of Gram-negative (EC - Escherichia coli and PA - Pseudomonas aeruginosa) and three strains of Gram-positive (SF - Streptococcus faecalis, MSSA, MRSA) and antifungal activities (CA - Candida albicans and AN Aspergillus niger) of all synthesized compounds are summarized in Tables 3 and 4. In antimicrobial evaluation, a series of 2,6disubstituted $1 H$-benzimidazole derivatives were inactive against Gram-negative strain PA (MIC $\geq 1024 \mu \mathrm{~g} \mathrm{~mL}{ }^{-1}$ ). Compounds $\mathbf{1 a - 1 n}, \mathbf{1 p}-1 \mathbf{w}, 2 \mathbf{a}-2 \mathbf{c}, \mathbf{2 e - 2 n}$, and $2 \mathbf{p}-2 \mathbf{w}$ showed weak to moderate activities against 4 strains of bacteria (EC, SF, MSSA, and MRSA) and 2 strains of fungi (MIC $\geq 32 \mu \mathrm{~g} \mathrm{~mL}{ }^{-1}$ ). Compound 10 (4-methylthio) showed good antibacterial activities against the Gram-positive strains MSSA and MRSA with MIC ranging between 16 to $32 \mu \mathrm{~g} \mathrm{~mL}{ }^{-1}$ as compared to ciprofloxacin (Cipro, MIC $=8-16 \mu \mathrm{~g} \mathrm{~mL}^{-1}$ ), but showed moderate activities against the strains EC, SF, CA, and AN (MIC $64 \mu \mathrm{~g} \mathrm{~mL}{ }^{-1}$ ). In addition, compounds 2 d (3,4-dichloro) and 20 (4-methylthio) showed good antibacterial activities against the Gram-positive strains SF, MSSA, and MRSA with MIC of 16,16 , and $32 \mu \mathrm{~g}$ $\mathrm{mL}^{-1}$, respectively as compared to Cipro (MIC $=8-16 \mu \mathrm{~g} \mathrm{~mL}{ }^{-1}$ ). However, these compounds showed moderate activities against the strains EC, CA, and AN (MIC $32-64 \mu \mathrm{~g} \mathrm{~mL}{ }^{-1}$ ). The results suggested that the 4 -methylthio group of the aromatic ring at position 2 of the $1 H$-benzimidazole scaffold enhanced antibacterial activities against MSSA and MRSA strains.

With antimicrobial activities of series of $N, 2,6$-trisubstituted $1 H$-benzimidazole derivatives, compounds $\mathbf{3 a - 3 e}, \mathbf{3 h}-\mathbf{3} \mathbf{j}, \mathbf{4 a}, \mathbf{4 b}$, $\mathbf{4 d} \mathbf{- 4 f}, \mathbf{4 h}, \mathbf{4 i}$, and $\mathbf{4 k}$ showed weak to moderate activities against

5 strains of bacteria and 2 strains of fungi (MIC $\geq 32 \mu \mathrm{~g} \mathrm{~mL}{ }^{-1}$ ). Compounds $3 f$ ( 3,4 -dichloro, $N$-benzyl), 31 ( 4 -chloro, $N$-(4chlorobenzyl)), and $\mathbf{4 g}$ (4-nitro, $N$-Benzyl) showed good antibacterial activities against the Gram-positive strains MSSA and MRSA with MIC of 8 and $16 \mu \mathrm{~g} \mathrm{~mL}^{-1}$, respectively. Compound $\mathbf{3 f}$ showed weak antimicrobial activities against strains EC, SF, CA, and AN with MIC $\geq 64 \mu \mathrm{~g} \mathrm{~mL}^{-1}$. Compound 31 showed good antimicrobial activities against strains EC, SF, CA, and AN with

MIC ranging between 16 to $32 \mu \mathrm{~g} \mathrm{~mL}$ activity against the Gram-negative strain PA with a MIC value of $256 \mu \mathrm{~g} \mathrm{~mL}$. . Compound $\mathbf{4 g}$ showed good antimicrobial activity against strain SF with MIC of $8 \mu \mathrm{~g} \mathrm{~mL}^{-1}$ as compared to Cipro ( $\mathrm{MIC}=8 \mu \mathrm{~g} \mathrm{~mL}{ }^{-1}$ ) and weak antimicrobial activity against the strains EC, PA, CA, and AN with MIC $\geq 64 \mu \mathrm{~g} \mathrm{~mL}{ }^{-1}$. Moreover, compounds $3 \mathbf{g}$ (3,4-dimethoxy, $N$-benzyl), $3 \mathbf{k}$ (4-nitro, $N$-benzyl), 4c (4-chloro, $N$-benzyl), and $\mathbf{4 j}$ (4-nitro, $N$-(4-chlorobenzyl))

Table 2 Yields and physicochemical parameters of N,2,6-trisubstituted $1 H$-benzimidazole derivatives ( $3 \mathrm{a}-3 \mathrm{l}$ and $4 \mathrm{a}-4 \mathrm{k})^{a}$

${ }^{a}$ Re and MW - yields of conventional heating (or reflux) and microwave-assisted method (\%), Re - reflux, MW - microwave, M. Wt - molecular weight, NHA - number of hydrogen bond acceptor, NHD - number of hydrogen bond donor, NRB - number rotatable bond, PSA - polar surface area (Angstroms squared).
exhibited the strongest activity among the synthesized compounds against the Gram-positive strains MSSA and MRSA with MIC ranging between 4 to $8 \mu \mathrm{~g} \mathrm{~mL}$-1 as compared to Cipro. However, compounds $\mathbf{3 g}$, $\mathbf{3 k}$, and $\mathbf{4 c}$ showed weak to moderate activities against strains EC, PA, SF, CA, and AN. In contrast, compound 4 c showed good antimicrobial activities against the bacteria strains EC, SF, and the fungi strain CA with the MIC value of $16 \mu \mathrm{~g} \mathrm{~mL}{ }^{-1}$ as compared to ciprofloxacin and fluconazole (Flu, MIC of $4 \mu \mathrm{~g} \mathrm{~mL}{ }^{-1}$ ), except for showed moderate antibacterial activity against Gram-negative strain PA. In particular, for antifungal activity, compound 4 c also displayed promising activity against Aspergillus niger with the MIC value of $32 \mu \mathrm{~g} \mathrm{~mL}{ }^{-1}$ as compared to Flu (MIC $=128 \mu \mathrm{~g} \mathrm{~mL}{ }^{-1}$ ). From the structure-activity relationship (SAR), the presence of the N benzyl group and the chloro/nitro group in the aromatic ring at position 2 of the $1 H$-benzimidazole scaffold is more desirable for enhanced antibacterial activity in $\mathbf{3 f}$, $\mathbf{3 1}, \mathbf{3 k}, \mathbf{4 c}$, and $\mathbf{4 j}$, and antifungal activity in $\mathbf{3 1}$ and 4c (Fig. 3).

In published studies, 4 -substituent 5,6-dichloro-1H-benzimidazole derivatives showed antibacterial activity against $S$. aureus with MIC $3.12 \mathrm{mg} \mathrm{mL}^{-1} .^{6}$ Besides, the 4 -nitro $1 H$ -benzimidazole-5-carbohydrazide derivative exhibited good inhibitory activity against lanosterol $14 \alpha$-demethylase (CYP51) with $\mathrm{IC}_{50}$ value at $0.19 \mu \mathrm{~g} \mathrm{~mL}{ }^{-1}$ compared to fluconazole as reference $\mathrm{IC}_{50}$ value at $0.62 \mu \mathrm{~g} \mathrm{~mL}^{-1} .{ }^{36}$ In addition, the pyridin3 -yl-1H-benzimidazole-5-carboxylate derivative was found to be potent activity against Mycobacterium tuberculosis H37Rv and

INH-resistant Mycobacterium tuberculosis with MIC value of $0.112 \mu \mathrm{M}$ and $6.12 \mu \mathrm{M}$, respectively. ${ }^{37}$ Especially, the 6 -fluoro$1 H$-benzimidazole derivative showed potent antibacterial activities against the Gram-positive strains MSSA (MIC of $4 \mu \mathrm{~g}$ $\mathrm{mL}^{-1}$ ) and MRSA (MIC of $2-8 \mu \mathrm{~g} \mathrm{~mL}{ }^{-1}$ ). ${ }^{8}$ Two synthesized compounds $3 \mathbf{k}$ and $\mathbf{4 c}$ with 2 -(4-nitro/chloro-phenyl) moiety also exhibited potent antibacterial activity with MICs of 4-8 $\mu \mathrm{g}$ $\mathrm{mL}^{-1}$ against MSSA and MSRA strains. This may be due to the structure of compound $3 \mathbf{k}$ with the presence of a 4-nitro group on the phenyl ring of the 1 H -benzimidazole nucleus is similar to that of Morcoss et al. (2020) and the structure of compound 4c with the presence of 4 -chloro group on the phenyl ring of the 1 H -benzimidazole nucleus is similar to that of Tunçbilek et al. (2009) and Em et al. (2022). ${ }^{4,6,36}$ However, compounds 3k and 4c have different substituent patterns compared to our previous most potent compounds. ${ }^{4}$

### 2.3. Anticancer activity

Next, we assessed the anticancer activity of compounds $\mathbf{1 a - 1 w}$, $\mathbf{2 a - 2 w}, \mathbf{3 a}-\mathbf{3 1}$, and $\mathbf{4 a}-\mathbf{4 k}$ on five cancer cell lines hepatocellular carcinoma cell line (HepG2), human breast cancer cell lines (MDA-MB-231 and MCF7), the aggressive and highly malignant rhabdomyosarcoma cell line (RMS), and colon carcinoma cell line (C26) using paclitaxel (PTX) as a non-selective positive control in MTT assay. The results are summarized in Tables 3 and 4

 compounds with the best MIC and $\mathrm{IC}_{50}$ values compared to positive controls.

Table 3 (Contd.)

In both series of $1 H$-benzimidazole derivatives, several compounds exhibited moderate $\left(\mathrm{IC}_{50}=15.0-50.0 \mu \mathrm{M}\right)$ or weak activity ( $\mathrm{IC}_{50}>50 \mu \mathrm{M}$ ) toward HepG2, MDA-MB-231, MCF7, RMS, and C26. Compounds $2 d$ and $2 \mathbf{j}$ showed good anticancer activity with $\mathrm{IC}_{50} 14.41$ and $6.76 \mu \mathrm{M}$, respectively as compared to PTX $\left(\mathrm{IC}_{50}=6.13 \mu \mathrm{M}\right)$ at the RMS cell line. Compound 2 g showed moderate anticancer activity against the MDA-MB-231 cell line with an $\mathrm{IC}_{50}$ value of $13.23 \mu \mathrm{M}$ as compared to $\operatorname{PTX}\left(\mathrm{IC}_{50}=1.38\right.$ $\mu \mathrm{M}$ ). On the other hand, compound $2 \mathbf{q}$ showed good anticancer activity against the MCF7 cell line with an $\mathrm{IC}_{50}$ value of $10.46 \mu \mathrm{M}$ as compared to PTX $\left(\mathrm{IC}_{50}=2.35 \mu \mathrm{M}\right)$. Compound 4 a showed good anticancer activity against the C 26 cell line with an $\mathrm{IC}_{50}$ value of $9.04 \mu \mathrm{M}$ as compared to PTX $\left(\mathrm{IC}_{50}=3.32 \mu \mathrm{M}\right)$. Particularly, nine compounds 1d (3,4-dichloro), 1k (5-bromo-2hydroxy), 1s (Anthracen-9-yl), 2k (5-bromo-2-hydroxy), 3k (4nitro, $N$-benzyl), $3 \mathbf{1}$ (4-chloro, $N$-(4-chlorobenzyl)), 4c (4-chloro, $N$-benzyl), $\mathbf{4 g}$ (4-nitro, $N$-benzyl), and $\mathbf{4 j}$ (4-nitro, $N$-(4-chlorobenzyl)) showed the strongest anticancer activity among the synthesized compounds against all tested cell lines with $\mathrm{IC}_{50}$ ranging between 2.39 to $13.20 \mu \mathrm{M}$ comparable to PTX $\left(\mathrm{IC}_{50}=\right.$ 1.38-6.13 $\mu \mathrm{M}$ ). Moreover, compound 4 c showed the strongest anticancer activity among all active compounds against HepG2, MDA-MB-231, MCF7, RMS, and C26 with $\mathrm{IC}_{50}$ of $3.22,2.39,5.66$, 4.83 , and $3.90 \mu \mathrm{M}$, respectively as compared to PTX. Compound 4c exhibited a weaker anticancer activity than PTX on MDA-MB231, MCF7, and C26 cell lines, but exhibited better anticancer activity than PTX on HepG2 and RMS cell lines (Fig. 4), and especially also showed potent antimicrobial activities (Table 4). Target engagement with electron-withdrawing substituents 4-Cl and $4-\mathrm{NO}_{2}$ on the phenyl ring, and $N$-phenyl and $N$-(4-chlorobenzyl) substituents of the $1 H$-benzimidazole scaffold may be responsible for its anticancer activity as compared to other compounds.

In published studies with similar structures, the 4 -fluorophenyl benzoimidazolylquinazolinamine derivative showed potent activity against tyrosine-protein kinase Met $\left(\mathrm{IC}_{50}\right.$ of 0.05 $\mu \mathrm{M}$ ) and vascular endothelial growth factor receptor 2 (VEGFR2 , $\mathrm{IC}_{50}$ of $0.02 \mu \mathrm{M}$ ). ${ }^{38}$ Besides, the 3,5-difluorophenyl benz-imidazole-oxindole conjugate derivative exhibited $43.7 \%$ and $64.8 \%$ apoptosis against MCF-7 at 1 and $2 \mu \mathrm{M}$, respectively. ${ }^{39}$ On the other hand, the 4 -( $N, N$-dimethylamino)phenyl $N, 2,5$-trisub-stituted-1H-benzimidazole derivative exhibited Sirtuins inhibitory activity for SIRT1 and SIRT2 with $\mathrm{IC}_{50}$ value of 54.21 and $26.85 \mu \mathrm{M}$, respectively. In addition, the 3-hydroxyphenyl 6-benzoyl-1 $H$-benzimidazole derivative exhibited good antitumor activity against human lung adenocarcinoma epithelial (A549, $\mathrm{IC}_{50}$ of $4.47 \mu \mathrm{M}$ ), human breast adenocarcinoma (MDA-MB-231, $\mathrm{IC}_{50}$ of $4.68 \mu \mathrm{M}$ ), and human prostate cancer ( $\mathrm{PC} 3, \mathrm{IC}_{50}$ of 5.50 $\mu \mathrm{M})$ cell lines. ${ }^{5}$ Cell proliferation assay demonstrated that this compound had pronounced anticancer activity against breast MDA-MB-468, colon HCT-116, and blood-leukemia CCRF-CEM cell lines. ${ }^{40}$ Moreover, the $N$-(3-phenylpropyl) N,2,5-trisubsti-tuted- $1 H$-benzimidazole derivative has been found to induce autophagy in MCF7 cells with $\mathrm{IC}_{50}$ value of $5.73 \pm 0.95 \mu \mathrm{M}$ by fluorescence microscope assays and western blot analysis. ${ }^{41}$ The 5-chloro- N -benzyl-1 H -benzimidazole also exhibited to arrest MCF-7 cell growth at the G2/M and S phases with $\mathrm{IC}_{50}$ value of

Table 4 Antimicrobial ( $\mathrm{MIC}, \mu \mathrm{g} \mathrm{mL}{ }^{-1}$ ) and anticancer $\left(\mathrm{IC}_{50}, \mu \mathrm{M}\right)$ activities of synthesized compounds $3 \mathrm{a}-31$ and $4 \mathrm{a}-4 \mathrm{k}^{a}$

${ }^{a}$ MIC $\geq 1024 \mu \mathrm{~g} \mathrm{~mL}$, , ND - not determined, EC - Escherichia coli ATCC 25922 , PA - Pseudomonas aeruginosa ATCC 27853 , SF - Streptococcus faecalis ATCC 29212, MSSA - Methicillin-susceptible strains of Staphylococcus aureus ATCC 29213, MRSA - Methicillin-resistant strains of Staphylococcus aureus ATCC 43300, CA - Candida albicans ATCC 10321, AN - Aspergillus niger ATCC 16404, Cipro - ciprofloxacin, Flu - fluconazole, MIC ( $\mu \mathrm{g}$ $\left.\mathrm{mL}^{-1}\right) \pm 0.5 \mu \mathrm{~g} \mathrm{~mL}^{-1}$. PTX - paclitaxel, HepG2 - human hepatocyte carcinoma cell line, MDA-MB-231 - human breast adenocarcinoma cell line, MCF7 - human breast cancer cell line, RMS - human rhabdomyosarcoma cell line, C 26 - colon carcinoma cell line. IC $50 \pm$ SEM ( $\mu \mathrm{M}$, SEM - standard error of the mean). The values in bold highlight the best compounds with the best MIC and IC ${ }_{50}$ values compared to positive controls.

Fig. 3 The structure of potential N,2,6-trisubstituted 1 H -benzimidazole derivatives.
$7.01 \pm 0.20 \mu \mathrm{M} .{ }^{42}$ Similar to reported potent compounds in literature, among our most active 2,6-disubstituted $1 H$-benzimidazole derivatives $\mathbf{3 1}$, $\mathbf{4 c}$, and $\mathbf{4 j}$ contain halogen substituents. This is similar to our previous most active compounds. ${ }^{4}$ Especially, compound 4c exhibited more potential antitumor activity against five different types of cancer cells when compared with the compounds of Yoon et al. (2014), Zhang et al. (2017), and Em et al. (2022). ${ }^{4,40,41}$ This may be due to the
structure of $\mathbf{4 c}$ having the presence of a chlorine substituent (Cl ) at position 4 on the phenyl ring and the $N$-benzyl group on the 1 H -benzimidazole scaffold. ${ }^{4}$

The development of compounds with multiple effects has been of increasing interest, especially with anticancer and antimicrobial activities. The dual-acting anticancer and antimicrobial chemotherapy agents have been published in many studies. ${ }^{4,43-46}$ Moreover, people with cancer may have a higher risk of infection due to changes in the immune system that controls their body's defenses. ${ }^{47}$ Therefore, our potential derivatives have shown to be promising agents in the development of dual therapeutic effects.

### 2.4. In silico ADMET profile

In this study, a computational study of all synthesized compounds was performed to determine the surface area and other physicochemical properties in the direction of Lipinski's rules (Tables 1 and 2)., ${ }^{4,29}$ The five most active compounds $\mathbf{3 k}, \mathbf{3 l}$, $\mathbf{4 c}, \mathbf{4 g}$, and $\mathbf{4 j}$ follow all of Lipinski's rules. All the highest active derivatives have a number of hydrogen bonding acceptor groups ranging between 1 to 3 , and nonhydrogen bonding donors. Also, molecular weights range between 329.35 to

Fig. 4 Comparison of anticancer activity ( $\mathrm{IC}_{50}$ values) between active compounds and PTX. (PTX - paclitaxel, HepG2 - human hepatocyte carcinoma cell line, MDA-MB-231 - human breast adenocarcinoma cell line, MCF7 - human breast cancer cell line, RMS - human rhabdomyosarcoma cell line, C26-colon carcinoma cell line, (*): significantly different compared with $\mathrm{IC}_{50}$ of 4 c and paclitaxel with $p<0.05$.
377.82 , and $\log P$ values range between 3.59 to 5.24 , and all these values agree with Lipinski's rules such as HB donor groups $\leq 5$, HB acceptor groups $\leq 10, \mathrm{M} . \mathrm{Wt}<500$, and $\log P<$ 5.

Computational ADMET profiling of active compounds (Table $\mathrm{S} 1 \dagger$ ), showed that these derivatives have better intestinal absorption in humans than Cipro, Flu, and PTX. In fact, all compounds showed Caco-2 permeability higher than the control drugs while only compounds $3 \mathbf{k}$ and $\mathbf{4 g}$ showed MDCK permeability higher than the control drugs. This preference may be due to the superior lipophilic of the designed ligands, which would facilitate passage along different biological membranes. ${ }^{4,29}$ Accordingly, they may have remarkably good bioavailability after oral administration. All compounds are highly likely to be Pgp-inhibitor similar to the PTX reference drug. This is advantageous for overcoming multidrug resistance in cancer. In addition, all compounds showed high plasma protein binding. Moreover, compound 4c demonstrated a high potential to penetrate the blood-brain barrier (BBB), while Cipro and PTX are unable to do it. Therefore, compound $4 \mathbf{4}$ showed potential for the treatment of brain tumors compared with reference drugs.

The molecule is less skin permeant, the more negative the $\log K_{\mathrm{p}}$ (with Kp in $\mathrm{cm} \mathrm{s}^{-1}$ ). Therefore, all active compounds (log $K_{\mathrm{p}}$ in the range of -5.10 to -4.23 ) showed better skin permeation than Cipro ( $\log K_{\mathrm{p}}$ of -9.09 ) and Flu ( $\log K_{\mathrm{p}}$ of -7.92 ). The cytochrome enzymes could be weak to strongly inhibited under the effect of active compounds especially CYP1A2, CYP2C19, and CYP2C9, while Cipro and Flu couldn't. Compounds 31 and 4c also strongly inhibit CYP2D6, while PTX couldn't. However, all compounds did not show the effect of CYP3A4 inhibition compared with PTX.

The CL (clearance) is a significant parameter in deciding dose intervals as a tool for the assessment of excretion. All active
compounds (5.05-6.94 $\mathrm{mL} \mathrm{min}^{-1} \mathrm{~kg}^{-1}$ ) and Flu (CL $=5.69$ $\mathrm{mL} \min ^{-1} \mathrm{~kg}^{-1}$ ) was classified as a moderate clearance level ranging between 5 to $15 \mathrm{~mL} \mathrm{~min}^{-1} \mathrm{~kg}^{-1}$. In contrast, Cipro ( 3.21 $\mathrm{mL} \mathrm{min}{ }^{-1} \mathrm{~kg}^{-1}$ ) and PTX ( $3.42 \mathrm{~mL} \mathrm{~min}{ }^{-1} \mathrm{~kg}^{-1}$ ) showed lower CL values and were classified as low clearance levels (CL < 5 $\mathrm{mL} \mathrm{min}{ }^{-1} \mathrm{~kg}^{-1}$ ).

Toxicity is the last parameter examined in the ADMET profile. As displayed in Table S1, $\dagger$ all the new ligands did not show H-HT (human hepatotoxicity), DILI (drug-induced liver injury), rat oral acute toxicity, and eye corrosion. In particular, the most potent compound $\mathbf{4 c}$ showed lower respiratory toxicity as well as the "Tox21 pathway" and "Toxicophore rules" properties better than the reference drugs.

### 2.5. In silico molecular docking studies

Following ADMET profiling, docking was used to assess the potential targets for the most active compounds. Based on the principle that similar compounds tend to bind to the same proteins as well as in vitro enzymes inhibition of the reported homologous benzimidazole structures, seven protein targets were chosen for docking study for the five most active compounds and reference compounds (Cipro - ciprofloxacin, Flu - fluconazole, and PTX - paclitaxel). ${ }^{4}$ Four different target proteins were selected for antimicrobial activity including dihydrofolate reductase (DHFR-F) and $N$-myristoyl transferase (NMT) from Candida albicans as fungal targets together with dihydrofolate reductase (DHFR-B) and gyrase B (GyrB) from Staphylococcus aureus as bacterial targets. ${ }^{29}$ Seven target proteins were selected for anticancer activity including DHFR-B, GyrB, DHFR-F, NMT, vascular endothelial growth factor receptor 2 (VEGFR-2), fibroblast growth factor receptor 1 (FGFR1), and histone deacetylase 6 (HDAC6) whose dysregulation is linked to cancer cell proliferation. On the other hand, nine

poses of each potent compound were obtained by the docking simulations with each receptor and the pose with the highest affinity (model 0 ) was chosen to validate the activity.

Among all these seven proteins, two proteins (DHFR-B and NMT) as both antimicrobial and antitumor targets presented good binding affinity with a higher affinity than -9.5 kcal-$\mathrm{mol}^{-1}$. On the other hand, two proteins (FGFR-1 and HDAC6) as antitumor targets presented good interactions with affinity in the range of -8.6 to $-10.0 \mathrm{kcal} \mathrm{mol}^{-1}$, while VEGFR-2 showed

Fig. 5 2D and 3D representation of the interaction of the active compounds ( 4 c and 4 g ), ciprofloxacin (Cipro), and paclitaxel (PTX) with dihydrofolate reductase of bacteria (DHFR-B).
weaker interactions with affinity in the range of -8.3 to $-9.0 \mathrm{kcal} \mathrm{mol}^{-1}$ with active derivatives (Table 5). Here in our study, compound $\mathbf{4 c}$ being the most potent antimicrobial and antitumor agent displayed the highest negative affinity of $-10.0 \mathrm{kcal} \mathrm{mol}^{-1}$ against DHFR-B, and the second negative affinity of $-11.1 \mathrm{kcal} \mathrm{mol}^{-1}$ against NMT from S. aureus which is comparable to Cipro (DHFR-B), Flu (NMT) and PTX (DHFR-B and NMT) with the affinity of $-9.1,-7.9$ and ( -10.0 and $-11.4) \mathrm{kcal} \mathrm{mol}^{-1}$, respectively. Besides, this compound established one strong hydrogen bond with SER49 amino acid of DHFR-B with a bond length of $2.97 \AA$ being similar to that of Cipro $(2.20 \AA$ ) and PTX $(1.87 \AA)$ ). In addition, compound $4 \mathbf{c}$ also established one strong hydrogen bond with HIS227 amino acid of NMT with a bond length of 2.21 A which is comparable to Flu (TYR225, 2.36 £̊), and PTX (GLY213, $2.23 \AA$ ). Although no hydrogen bond was established, compound 4c showed a good affinity for FGFR1 of $-9.6 \mathrm{kcal} \mathrm{mol}^{-1}$ compared with PTX ( $-10.5 \mathrm{kcal} \mathrm{mol}^{-1}$ which established three hydrogen bonds at ASN628, GLU486, and THR658 amino acids. Hence compound $4 \mathbf{c}$ is considered the best dock conformation in antimicrobial and antitumor targets.

On the DHFR-B receptor, compound $\mathbf{3 k}$ established two hydrogen bonds ( $2.30-2.67 \AA$ ) with the affinity ( $-9.6 \mathrm{kcal} \mathrm{mol}^{-1}$ ) with ASN18, THR121 amino acids, but compounds $\mathbf{4 g}$ and $\mathbf{4 j}$ only established one hydrogen bond ( $2.35-2.58 \AA$ ) with the affinity ( -9.9 to $-10.0 \mathrm{kcal} \mathrm{mol}^{-1}$ ) with ASN18 amino acid when compared with the standard drug Cipro ( $-9.1 \mathrm{kcal} \mathrm{mol}^{-1}$ ) with one hydrogen bond $(2.20 \AA$ ) with SER49 amino acid and PTX ( $-10.0 \mathrm{kcal} \mathrm{mol}^{-1}$ ) with three hydrogen bonds (1.87-3.01 $\AA$ ) with LEU20, SER49, THR121 amino acids (Fig. 5). However, compound 31 ( $-9.5 \mathrm{kcal} \mathrm{mol}^{-1}$ ) established one hydrogen bond ( 2.89 Å) with SER49 amino acid similar to 4c, Cipro, and PTX. These results have demonstrated that compound $\mathbf{4 c}$ is the most potential in vitro antibacterial and antitumor activities.

On the GyrB receptor, all active compounds showed good interactions with affinity in the range of -7.9 to $-8.1 \mathrm{kcal} \mathrm{mol}^{-1}$ compared with the standard drug Cipro ( $-7.3 \mathrm{kcal} \mathrm{mol}^{-1}$ ) and PTX ( $-7.8 \mathrm{kcal} \mathrm{mol}^{-1}$ ). Similarly, all active compounds also showed good interactions with affinity in the range of -8.0 to $-8.8 \mathrm{kcal} \mathrm{mol}^{-1}$ compared with the standard drug Flu ( $-7.0 \mathrm{kcal} \mathrm{mol}^{-1}$ ) and PTX ( $-8.5 \mathrm{kcal} \mathrm{mol}{ }^{-1}$ ) on DHFR-F receptor. However, these compounds established fewer hydrogen bonds than the standard drugs.

On the NMT receptor, compounds $\mathbf{3 k}$ and $3 \mathbf{1}$ established one hydrogen bond (2.61-2.71 $\AA$ ) with good affinity ( -11.0 to $-11.3 \mathrm{kcal} \mathrm{mol}^{-1}$ ) with ASN392 amino acid compared with Flu ( $-7.9 \mathrm{kcal} \mathrm{mol}{ }^{-1}$ ), PTX ( $-11.4 \mathrm{kcal} \mathrm{mol}^{-1}$ ), and $\mathbf{4 c}$ $\left(-11.1 \mathrm{kcal} \mathrm{mol}^{-1}\right)$ (Fig. 6). On the contrary, compounds 4 g and $4 \mathbf{j}$ did not establish hydrogen bonds with affinity at -10.3 and $-10.6 \mathrm{kcal} \mathrm{mol}^{-1}$, respectively.

On the VEGFR-2 receptor, all active compounds showed stronger interactions with the affinity between -8.3 and $-9.0 \mathrm{kcal} \mathrm{mol}^{-1}$ compared with the reference drug PTX ( $-7.8 \mathrm{kcal} \mathrm{mol}^{-1}$ ). Compounds $\mathbf{3 k}, \mathbf{4 g}$, and $\mathbf{4 j}$ established one hydrogen bond (2.56-2.78 Å) with ARG1027 amino acid. Compounds $3 \mathbf{l}$ and $\mathbf{4 c}$ did not establish conventional hydrogen
bonds but established carbon-hydrogen bonds with ASP1046 amino acid with bond lengths in the range of 3.13 to $3.56 \AA$.

On the FGFR-1 receptor, all active compounds did not establish a hydrogen bond except for $\mathbf{4 j}$ established one hydrogen bond ( $2.67 \AA$ ) with ASP641 amino acid. In addition, these compounds showed weaker interactions with the affinity between -9.3 and $-10.0 \mathrm{kcal} \mathrm{mol}^{-1}$ compared with the

Fig. 62 D and 3D representation of the interaction of the active compounds ( 31 and 4 c ), fluconazole (Flu), and paclitaxel (PTX) with N myristoyl transferase (NMT).
reference drug PTX ( $-10.5 \mathrm{kcal} \mathrm{mol}^{-1}$ ). On the HDAC6 receptor, all active compounds showed stronger interactions with the affinity between -9.1 and $-9.5 \mathrm{kcal} \mathrm{mol}^{-1}$ except for $\mathbf{4 c}$ when compared with reference drug PTX ( $-8.8 \mathrm{kcal} \mathrm{mol}^{-1}$ ). However, these compounds have formed fewer hydrogen bonds than PTX (Fig. 7). These results suggested that FGFR-1 and HDAC6 also are the most likely targets for the anticancer activity of these newly synthesized agents.

Among all the derivatives, compound 4c showed hydrophobic interactions ( $\pi-\pi$ T-shaped, alkyl, $\pi$-alkyl) with PHE98, LEU20, and ILE14 with the crucial residue of the DHFR-B protein from $S$. aureus that resembles the co-crystallization ligand, Cipro, and PTX. As illustrated in Fig. 5, the 6-methyl $\left(6-\mathrm{CH}_{3}\right)$ group and 1 H -benzimidazole nucleus of compound $\mathbf{4 c}$ were engaged in the formation of alkyl and $\tau$-alkyl interactions with LEU20 amino acid with bond length in the range of 4.17$5.15 \AA$. Moreover, the $N$-benzyl group displayed $\pi-\pi$ T-shaped

Fig. 7 2D and 3D representation of the interaction of the active compounds ( 4 c and 4 g ), and paclitaxel (PTX) with histone deacetylase 6 (HDAC6).

Table 6 The 50\% inhibitory concentration ( $\mathrm{IC}_{50}$ ) of active compounds for in vitro DHFR inhibitory activity

| Compound | DHFR inhibitory <br> activities $\left(\mathrm{IC}_{50}, \mu \mathrm{M}\right)$ |
| :--- | :--- |
| $\mathbf{3 k}$ | 12.32 |
| $\mathbf{3 1}$ | 10.64 |
| $\mathbf{4 c}$ | 2.35 |
| $\mathbf{4 g}$ | 6.78 |
| $\mathbf{4 j}$ | 8.01 |
| Methotrexate | 0.021 |

interaction with the crucial residue PHE98 of the target protein with a bond length of $5.47 \AA$ and $\pi$-alkyl interaction with ILE14 amino acid with a bond length of $4.80 \AA$. On the other hand, compound $\mathbf{4 c}$ also established electrostatic interaction ( $\pi$-cation) and hydrophobic interactions ( $\pi-\pi$ stacked, $\pi-\pi$ T-shaped, alkyl, $\pi$-alkyl) with the crucial residue of the NMT protein from Candida albicans that resembles the cocrystallization ligand, Flu, and PTX. The 6-methyl $\left(6-\mathrm{CH}_{3}\right)$ group showed alkyl and $\pi$-alkyl interactions with LEU394 and TYR354 amino acids with bond lengths in the range of 4.09$5.31 \AA$. In addition, the substituted part of compound $4 \mathbf{c}$ moved inside the cavity where both the benzene ring of $N$-benzyl and 2 phenyl groups and the $1 H$-benzimidazole nucleus were observed to establish hydrophobic interactions ( $\pi-\pi$ stacked and $\pi-\pi$ T-shaped) with TYR225, PHE240, PHE117, and PHE339 amino acids with a bond length of 3.82, 5.36, 5.03, and $5.04 \AA$, respectively. Besides, the 2-phenyl groups of the $1 H^{-}$ benzimidazole nucleus showed electrostatic interaction ( $\pi-$ cation) with HIS227 amino acid with a bond length of $4.24 \AA$. Especially, 4-chloro (4-Cl) of 2-phenyl ring displayed $\pi$-alkyl interaction with PHE115, PHE240, and PHE339 amino acids with a bond length of $3.55,4.45$, and $4.64 \AA$, respectively (Fig. 6). The resulting docking may therefore suggest that its potent antibacterial, antifungal, and antitumor activities are mediated via interaction with DHFR and NMT proteins.

As to the selectivity prediction, the binding affinity in the range of -9.4 to $-10.6 \mathrm{kcal} \mathrm{mol}^{-1}$ of compounds 4 g and 4 j are essentially similar on the DHFR-B, NMT, FGFR-1, and HDAC6 receptors. Compounds $\mathbf{3 k}$ and $3 \mathbf{1}$ showed similar affinity ( -9.1 to $-9.7 \mathrm{kcal} \mathrm{mol}^{-1}$ ) on the DHFR-B, FGFR-1, and HDAC6 receptors. However, compounds $\mathbf{3 k}, \mathbf{3 l}$, and $\mathbf{4 c}$ are predicted to be selective on the NMT receptor as having high affinity in the range of -11.0 to $-11.3 \mathrm{kcal} \mathrm{mol}^{-1}$. Moreover, compound $\mathbf{4 c}$ also exhibited higher selectivity on the DHFR receptor than other potential compounds due to the difference in the range of -1.3 to $-2.1 \mathrm{kcal} \mathrm{mol}^{-1}$ compared with GyrB, DHFR-F, VEGFR2 , and HDAC6 receptors.

### 2.6. In vitro DHFR inhibitory activity

The results of in silico molecular docking studies have predicted that DHFR is a potential receptor to explain the mechanism of antimicrobial and anticancer activities for the active derivatives. So, these compounds were tested for their ability to inhibit
human DHFR and their potencies ( $\mathrm{IC}_{50}$ values) were measured in vitro. DHFR inhibition assay kit, involving the DHFRmediated conversion of dihydrofolate to tetrahydrofolate in the presence of NADPH (reduced nicotinamide adenine dinucleotide phosphate) has been used to investigate the inhibition of DHFR of active compounds $\mathbf{3 k}, \mathbf{3 l}, \mathbf{4 c}, \mathbf{4 g}$, and $\mathbf{4 j}$. It has been observed that compound 4 c showed the best activity at a low $\mu \mathrm{M}$ concentration of $2.35 \mu \mathrm{M}$ (Table 6). In addition, compounds $\mathbf{3 k}$, 31, $\mathbf{4 g}$, and $\mathbf{4 j}$ showed good inhibitory activity towards DHFR enzyme immunoassay with $\mathrm{IC}_{50}$ in the range of $6.78-12.32 \mu \mathrm{M}$. On the other hand, benzimidazole derivatives, for example, quinazolinone-benzimidazole and triazine-benzimidazole hybrids have also been reported to strongly inhibit DHFR. ${ }^{30,48}$ Therefore, the results suggest that DHFR is a target for compound $4 \mathbf{c}$ 's antimicrobial and anticancer activities as shown by both in silico and in vitro studies.

## 3. Conclusion

In summary, starting from 1,2phenylenediamine and 4-Me-1,2phenylenediamine, forty-six 2,6 -disubstituted $1 H$-benzimidazole and twenty-three $N, 2,6$-trisubstituted $1 H$-benzimidazole derivatives including sixteen new compounds have been designed, synthesized, and evaluated for their antimicrobial and anticancer activities. The microwave-assisted method has contributed to a significant reduction in reaction time and a significant increase in product yield. In addition, the values of the MIC against microorganisms showed that some compounds have significant inhibitory effects, especially compounds $\mathbf{3 k}$, 31, $\mathbf{4 c}, \mathbf{4 g}$, and $\mathbf{4 j}$ are potent for antibacterial activity against Grampositive and Gram-negative bacteria compared with standard drug Cipro while compounds $\mathbf{3 k}$, $\mathbf{3 1}$, and $\mathbf{4 c}$ are potent for antifungal activity compared with standard drug Flu. In particular, these compounds also exhibited potent anticancer activity with $\mathrm{IC}_{50}<10 \mu \mathrm{M}$ against all tested cell lines (HepG2, MDA-MB-231, MCF7, RMS, and C26) compared with the reference drug PTX. From the structure-activity relationship, the presence of the $N$-benzyl group and the 4 -chloro/4-nitro group in the aromatic ring at position 2 of the $1 H$-benzimidazole scaffold is more desirable for enhanced antibacterial activity as well as antitumor activity in $\mathbf{3 f}, \mathbf{3 1}, \mathbf{3 k}, \mathbf{4 c}$, and $\mathbf{4 j}$, and antifungal activity in 31 and 4c. Molecular docking predicted that DHFR (dihydrofolate reductase) protein from $S$. aureus and NMT ( $N$ myristoyl transferase) protein from C. albicans are the most suitable targets for the antimicrobial and anticancer activities. Compound 4c being the most potent antimicrobial and anticancer displayed a good affinity of $-11.1 \mathrm{kcal} \mathrm{mol}^{-1}$ with the NMT enzyme from C. albicans and showed a good affinity of $-10.0 \mathrm{kcal} \mathrm{mol}^{-1}$ with the crucial residue of the DHFR-B protein from $S$. aureus as well as showed electrostatic and hydrophobic interactions that resemble the co-crystallization ligand and reference drugs. Moreover, compound 4c showed good activity at a low $\mu \mathrm{M}$ concentration of $2.35 \mu \mathrm{M}$. Computational ADMET profiling for the five most active compounds in comparison to ciprofloxacin, fluconazole, and paclitaxel as reference drugs suggests that our derivatives have good ADMET profiles. Moreover, all compounds show physical-chemical properties of
fragment and lead-like compounds which are of great interest for further drug development. This work paved the way for the synthesis of more potent antimicrobial and anticancer benzimidazole derivatives.

## 4. Experimental section

### 4.1. Materials

All chemicals and solvents were of analytical grade and obtained from Merck, Germany. The reactions were monitored by thin-layer chromatography (TLC, E-Merck Kieselgel $60 \mathrm{~F}_{254}$ ). The column chromatography was carried out with the indicated solvents using silica gel (particle size $0.040-0.063 \mathrm{~mm}$ ) from Merck (Germany). The microwave-assisted reactions were performed by the microwave synthesizer (CEM Discover, USA) with continuous stirring and controlled temperature. Melting points ( $\mathrm{mp},{ }^{\circ} \mathrm{C}$ ) of all compounds were determined in an open capillary using a Gallenkamp melting point apparatus without any correction. The infrared (IR) spectra were recorded using a Shimadzu FT-IR (IRAffinity-1S) spectrometer. An Agilent Technology LC-mass spectrometer with ESI ionization (1100 series LC/MSD Trap) was used to record the mass spectra (MS). A Bruker Avance $500\left({ }^{1} \mathrm{H}, 500 \mathrm{MHz} ;{ }^{13} \mathrm{C}, 125 \mathrm{MHz}\right)$ NMR spectrometer was used to record the ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra at ambient temperature using DMSO- $\mathrm{d}_{6}$ as solvent. Chemical shifts are reported in parts per million (ppm) relative to the residual solvent peak as follows: DMSO- $\mathrm{d}_{6}=2.50 \mathrm{ppm}\left({ }^{1} \mathrm{H}\right.$ NMR) and DMSO- $\mathrm{d}_{6}=40.00 \mathrm{ppm}\left({ }^{13} \mathrm{C}\right.$ NMR). The Multiskan microplate reader was used to measure optical density (OD) at 570 nm .

### 4.2. Experimental procedures

4.2.1 General procedure for the preparation of 2,6-disubstituted $\mathbf{1 H}$-benzimidazole derivatives ( $\mathbf{1 a}-1 \mathrm{w}$ and $2 \mathrm{a}-\mathrm{w}$ )
4.2.1.1 Refluxing method. A mixture of benzene-1,2-diamine or 4-methylbenzene-1,2-diamine ( 5 mmol ), the substituted aromatic aldehydes ( 5 mmol ), and $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{5}(20 \mathrm{mmol})$ in a mixture of $\mathrm{EtOH}: \mathrm{H}_{2} \mathrm{O}(30 \mathrm{~mL}, 9: 1, \mathrm{v} / \mathrm{v})$ was refluxed for 612 h at $80^{\circ} \mathrm{C}$. After cooling down, the mixture was poured into cooled water and filtered off in a Büchner funnel. The resulting solid was purified by silica gel column chromatography using hexane/ethyl acetate as eluent. Yields: 75-93\%.
4.2.1.2 Microwave-assisted method. A mixture of benzene-1,2-diamine or 4 -methylbenzene-1,2-diamine ( 5 mmol ), the substituted aromatic aldehydes $(5 \mathrm{mmol}), \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{5}(20 \mathrm{mmol})$ in a mixture of $\mathrm{EtOH}: \mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL}, 9: 1$, $\mathrm{v} / \mathrm{v})$ was placed in a microwave oven and irradiated at a power of 300 W for $10-$ 15 min at $80^{\circ} \mathrm{C}$. After cooling down, the mixture was poured into cooled water and filtered off in a Büchner funnel. The resulting solid was purified by silica gel column chromatography using hexane/ethyl acetate as eluent. Yields: 90-99\%.

2-(2-Chlorophenyl)-1H-benzimidazole (1a): yellow solid, mp $228-229^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{DMSO}^{-} \mathrm{d}_{6}, \delta \mathrm{ppm}$ ): $12.70(1 \mathrm{H}, \mathrm{s}$, $-\mathrm{NH}-), 7.90\left(1 \mathrm{H}, \mathrm{dd}, J=7.5,2.0 \mathrm{~Hz}, \mathrm{H}_{\mathrm{Ar}}\right), 7.66-7.61\left(3 \mathrm{H}, \mathrm{m}, \mathrm{H}_{\mathrm{Ar}}\right)$, 7.56-7.50 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{H}_{\mathrm{Ar}}$ ), $7.24\left(2 \mathrm{H}, \mathrm{m}, \mathrm{H}_{\mathrm{Ar}}\right) .{ }^{13} \mathrm{C}$ NMR ( 125 MHz , DMSO-d $\left._{6}, \delta \mathrm{ppm}\right): 149.0,132.0,131.6,131.1,130.7,130.3,129.9$,
127.4, 122.2. LC-MS $(m / z)[M-H]^{-}$calcd for $\mathrm{C}_{13} \mathrm{H}_{8} \mathrm{ClN}_{2}$ 227.0381, found 227.0399; $[M+H]^{+}$calcd for $\mathrm{C}_{13} \mathrm{H}_{10} \mathrm{ClN}_{2}$ 229.0527, found 229.0462.

2-(4-Chlorophenyl)-1H-benzimidazole (1b): yellow solid, mp 290-291 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( 500 MHz, DMSO-d $_{6}, \delta \mathrm{ppm}$ ): $8.19(2 \mathrm{H}, \mathrm{d}, J$ $\left.=8.5 \mathrm{~Hz}, \mathrm{H}_{\mathrm{Ar}}\right), 7.63-7.60\left(4 \mathrm{H}, \mathrm{m}, \mathrm{H}_{\mathrm{Ar}}\right), 7.22(2 \mathrm{H}, \mathrm{d}, J=8.5 \mathrm{~Hz}$, $\mathrm{H}_{\mathrm{Ar}}$ ). ${ }^{13} \mathrm{C}$ NMR ( 125 MHz, DMSO- $_{6}, \delta \mathrm{ppm}$ ): 150.2, 134.6, 131.2, 130.8, 129.1, 129.0, 128.98, 128.8, 128.78, 128.2, 128.0, 122.4. LC-MS $(\mathrm{m} / \mathrm{z})[\mathrm{M}-\mathrm{H}]^{-}$calcd for $\mathrm{C}_{13} \mathrm{H}_{8} \mathrm{ClN}_{2}$ 227.0381, found 227.0389; $[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{13} \mathrm{H}_{10} \mathrm{ClN}_{2}$ 229.0527, found 229.0636.

2-(2,4-Dichlorophenyl)-1H-benzimidazole (1c): white solid, mp $232-233{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( 500 MHz, DMSO- $_{6}, \delta \mathrm{ppm}$ ): $12.77(1 \mathrm{H}, \mathrm{s}$, $-\mathrm{NH}-), 7.94\left(1 \mathrm{H}, \mathrm{d}, J=8.5 \mathrm{~Hz}, \mathrm{H}_{\mathrm{Ar}}\right), 7.85\left(1 \mathrm{H}, \mathrm{d}, J=2.0 \mathrm{~Hz}, \mathrm{H}_{\mathrm{Ar}}\right)$, $7.70\left(1 \mathrm{H}, \mathrm{s}, \mathrm{H}_{\mathrm{Ar}}\right), 7.63-7.58\left(2 \mathrm{H}, \mathrm{m}, \mathrm{H}_{\mathrm{Ar}}\right), 7.25\left(2 \mathrm{H}, \mathrm{s}, \mathrm{H}_{\mathrm{Ar}}\right) .{ }^{13} \mathrm{C}$ NMR ( 125 MHz, DMSO-d $_{6}, \delta \mathrm{ppm}$ ): 148.1, 143.1, 135.0, 134.6, 133.2, 132.6, 129.9, 128.9, 127.7, 122.9, 121.8, 119.2, 111.8. LCMS $(m / z)[\mathrm{M}-\mathrm{H}]^{-}$calcd for $\mathrm{C}_{13} \mathrm{H}_{7} \mathrm{Cl}_{2} \mathrm{~N}_{2}$ 260.9992, found 260.9952; $[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{13} \mathrm{H}_{9} \mathrm{Cl}_{2} \mathrm{~N}_{2}$ 263.0137, found 262.9776.

2-(3,4-Dichlorophenyl)-1H-benzimidazole (1d): white solid, mp $237-238{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( 500 MHz, DMSO-d $_{6}, \delta \mathrm{ppm}$ ): $13.07(1 \mathrm{H}, \mathrm{s}$, $-\mathrm{NH}-), 8.39\left(1 \mathrm{H}, \mathrm{d}, J=1.0 \mathrm{~Hz}, \mathrm{H}_{\mathrm{Ar}}\right), 8.15(1 \mathrm{H}, \mathrm{dd}, J=8.0,1.0 \mathrm{~Hz}$, $\left.\mathrm{H}_{\text {Ar }}\right), 7.83\left(1 \mathrm{H}, \mathrm{d}, J=8.5 \mathrm{~Hz}, \mathrm{H}_{\mathrm{Ar}}\right), 7.67-7.57\left(2 \mathrm{H}, \mathrm{m}, \mathrm{H}_{\mathrm{Ar}}\right), 7.24$ $\left(2 \mathrm{H}, \mathrm{s}, \mathrm{H}_{\mathrm{Ar}}\right) .{ }^{13} \mathrm{C}$ NMR ( 125 MHz, DMSO-d $_{6}, \delta \mathrm{ppm}$ ): 148.8, 132.2, $131.8,131.3,131.0,130.9,130.7,127.9,126.4,123.1,122.1$, 119.0, 111.5. LC-MS $(\mathrm{m} / \mathrm{z})[\mathrm{M}-\mathrm{H}]^{-}$calcd for $\mathrm{C}_{13} \mathrm{H}_{7} \mathrm{Cl}_{2} \mathrm{~N}_{2}$ 260.9992, found 260.9905; $[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{13} \mathrm{H}_{9} \mathrm{Cl}_{2} \mathrm{~N}_{2}$ 263.0137, found 262.9993.

4.2.2 General procedure for the preparation of $N, 2,6$ trisubstituted $\mathbf{1 H}$-benzimidazole derivatives ( $3 \mathrm{a}-1$ and $\mathbf{4 a}-\mathrm{k}$ )
4.2.2.1 Refluxing method. The mixture of 2,6-disubstituted $1 H$-benzimidazole derivatives $\mathbf{1 - 2}(1 \mathrm{mmol})$, potassium carbonate ( 1 mmol ), and substituted halides ( 1.2 mmol ) in acetonitrile $(10 \mathrm{~mL})$ was heated at $80{ }^{\circ} \mathrm{C}$ for $12-24 \mathrm{~h}$ and monitored by TLC. After cooling down, the mixture was poured into cooled water and filtered off in a Büchner funnel. The resulting solid was purified by silica gel column chromatography using hexane/ethyl acetate as eluent. Yields: 35-86\%.
4.2.2.2 Microwave-assisted method. The mixture of 2,6disubstituted $1 H$-benzimidazole derivatives $\mathbf{1 - 2}(1 \mathrm{mmol})$, potassium carbonate ( 1 mmol ), and substituted halides (1.2 $\mathrm{mmol})$ in acetonitrile $(10 \mathrm{~mL})$ was irradiated at a power of 300 W for $20-60 \mathrm{~min}$ at $80^{\circ} \mathrm{C}$. After cooling down, the mixture was poured into cooled water and filtered off in a Büchner funnel. The resulting solid was purified by silica gel column chromatography using hexane/ethyl acetate as eluent. Yields: 46-98\%.

### 4.3. In vitro antibacterial and antifungal activities

The minimum inhibitory concentration (MIC) was determined by the microtitre broth dilution method with positive controls (ciprofloxacin for antibacterial activity and fluconazole for
antifungal activity). ${ }^{4,29}$ All bacterial strains were maintained at $\pm 37^{\circ} \mathrm{C}$ for $24-48 \mathrm{~h}$ on a nutrient agar medium. Meanwhile, all fungal strains were maintained at $\pm 25{ }^{\circ} \mathrm{C}$ for 48 h on potato dextrose agar. The different concentration gradients ( $2,4,8,16$, $32,64,128,256,512$, and $1024 \mu \mathrm{~g} \mathrm{~m}^{-1}$ ) of tested compounds and positive controls were prepared in the media. The inoculum was prepared by dilution in broth media of each bacteria and fungi to give a final concentration of $5 \times 10^{5} \mathrm{CFU} \mathrm{mL}{ }^{-1}$. The trays were covered and placed in plastic bags to prevent evaporation and are then incubated at $35{ }^{\circ} \mathrm{C}$ for $18-20 \mathrm{~h}$ with the bacteria, and at $25^{\circ} \mathrm{C}$ for 72 h with fungi. The MIC was determined to be the lowest concentration that completely inhibits the growth of the organism. All MIC determinations were done in triplicates in independent experiments.

### 4.4. In vitro anticancer activity

The cytotoxic activity of the synthesized compounds was evaluated using the methyl thiazolyl tetrazolium (MTT) method. Paclitaxel as anticancer drug was used as the positive control. The MTT assay detects the reduction of yellow tetrazolium by metabolically active cells to be purple formazan measured using spectrophotometry. ${ }^{2,50}$ The cells lines were seeded into 96 -well plates at a density of $5 \times 10^{3}$ cells per well and replenished with growth media including Eagle's Minimum Essential Medium (EMEM), 10\% Fetal Calf Serum (FCS), 2 mM l-glutamine, 100 IU per mL penicillin, and $100 \mu \mathrm{~g}$ per mL streptomycin. The cells were incubated at $37{ }^{\circ} \mathrm{C}$ for 24 h in $5 \% \mathrm{CO}_{2}$. A series of concentrations ( $0.5,1,5,10,25,50,80$, and $100 \mu \mathrm{M}$ ) of the tested compounds and paclitaxel in DMSO was then added to each well of the 96 -well plate and incubated for 48 h using the control DMSO at the same concentration. Next, the plate was incubated at $37^{\circ} \mathrm{C}$ for 4 h in a $\mathrm{CO}_{2}$ incubator after $10 \mu \mathrm{~L}$ fresh solution of MTT reagent was added to each well. Finally, after the purple precipitate was obtained, the cells were dissolved in ethanol and their optical density was recorded at 570 nm using a microplate reader. The experiment was conducted on 6 wells for each concentration of the test sample. The percent of proliferation inhibition was calculated using the following formula:
Viability cell inhibition $(\%)=100-\left[\frac{\left(\mathrm{OD}_{\mathrm{t}}-\mathrm{OD}_{\mathrm{b}}\right)}{\left(\mathrm{OD}_{\mathrm{c}}-\mathrm{OD}_{\mathrm{b}}\right)}\right] \times 100 \%$ where $\mathrm{OD}_{\mathrm{t}}$ is the optical density of test compound, $\mathrm{OD}_{\mathrm{b}}$ is the optical density of blank, $\mathrm{OD}_{\mathrm{c}}$ is the optical density of control.

The $50 \%$ inhibitory concentration ( $\mathrm{IC}_{50}$ ) of each compound was calculated using the correlation plot between percent of proliferation inhibition and corresponding concentration via Graphpad Prism version 8.30.

### 4.5. ADMET predictions

The physicochemical properties of all compounds were calculated using the SwissADME web tool and ADMETlab 2.0 descriptors algorithm protocol. In silico prediction of the ADME (absorption, distribution, metabolism, and excretion) properties and the toxicity (T) risks was performed using ADMETlab 2.0 descriptors algorithm protocol. ${ }^{49}$

### 4.6. In silico molecular docking studies

The structure of ligands were drawn in ChemBioDraw Ultra 19. The energy of these ligands was minimized using ChemBio3D Ultra 19. Protein molecules of dihydrofolate reductase (PDB ID: 4HOF and 3FYV), $N$-myristoyl transferase (PDB ID: 1IYL), gyrase B (PDB ID: 4URM), vascular endothelial growth factor receptor 2 (PDB ID: 5EW3), fibroblast growth factor receptor 1 (PDB ID: 5A46), and histone deacetylase 6 (PDB ID: 5EEF) were retrieved from the protein data bank (https://rcsb.org). After all the water molecules have been removed, the receptors were added to only polar hydrogen and Kollman charges. The grid box for docking simulations was set by AutoDock tools. Next, the ligand molecules with minimized energy were inputted and carried out in the docking simulation using AutoDock Vina. ${ }^{51}$

All the minimizations were performed by AutoDock Vina docking simulation protocol with AMBER force field and the partial charges were automatically calculated. The electrostatic potential was shown for the interaction of two oppositelycharged atoms with a full atomic charge. The search algorithm of AutoDock Vina is a Monte-Carlo iterated search combined with the BFGS17 gradient-based optimizer, which comprises iterations of sampling, scoring, and optimization. AutoDock Vina actually uses a united-atom scoring function (one that involves only the heavy atoms) with combines knowledge-based and empiric scoring function features as well as supports the AutoDock4.2 scoring function. ${ }^{52}$ Besides, AutoDock Vina was compiled and run under Windows 10.0 Professional operating system. Discovery Studio 2021 was used to deduce the pictorial representation of the interaction between the ligands and the target protein.

### 4.7. In vitro dihydrofolate reductase inhibition assay

The dihydrofolate reductase (DHFR) inhibition assay was performed as per the manual of the CS0340 DHFR assay kit (Sigma, USA). 10 mM stock solutions of dihydrofolic acid and NADPH (reduced nicotinamide adenine dinucleotide phosphate) were prepared in assay buffer with a pH value of 7.5 . The five different concentrations $\left(10^{-8}, 10^{-7}, 10^{-6}, 10^{-5}\right.$, and $\left.10^{-4} \mathrm{M}\right)$ of the test compounds and methotrexate (as a positive control) in DMSO solvent were added to the respective wells of the 96 -well plate containing assay buffer so the final concentration of DMSO was $0.4 \%$ in each experiment. The changes in absorbance were monitored at 340 nm wavelength as a function of time using the test samples. After nullifying the effects (such as NADPH, folate, and solvent), the percentage inhibition of enzymatic activity was calculated. The $50 \%$ inhibitory concentration $\left(\mathrm{IC}_{50}\right)$ of each compound was calculated by plotting a graph between percentage inhibition and the corresponding concentration of the compound using Graphpad Prism version $8 .^{50}$

### 4.8. Statistical analysis

All values are expressed in mean $\pm$ SEM (Standard Error of Mean). The difference in $\mathrm{IC}_{50}$ value between tested compounds and positive control was analyzed by one-way ANOVA (analysis of variance) with Tukey HSD (Tukey's honestly significant
difference) post hoc test using Minitab version 19.0 software. The results were considered statistically significant if the $p$ value < 0.05 . The chart is drawn using Microsoft Excel 2021 software.
