Site-selective carbonylation of arenes *via* C(sp²)-H thianthrenation: direct access to 1,2-diarylethanones

Site-selective C-H thianthrenation of 2-substituted thiophenes to form thianthrene derivatives.

Reagents and conditions: Pd, Zn, CO, BnCl.

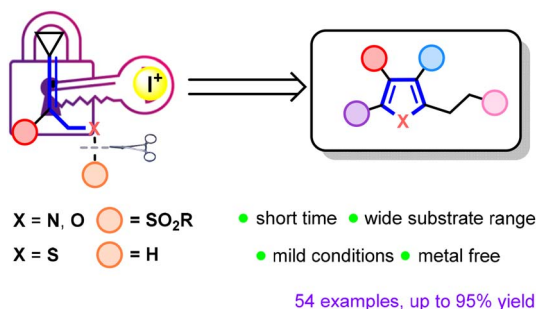

Advantages:

- Site-selective C-H carbonylation
- Good functional group tolerance
- Low-cost palladium catalyst
- Excellent yield, up to 99%
- Mild conditions

Real-time cell metabolism assessed repeatedly on the same cells *via* para-hydrogen induced polarization

The diagram illustrates a metabolic cycle within a cell. At the top, a blue box labeled "PHIP - SAH" indicates an inhibitory signal. The cycle is divided into two horizontal regions: a pink upper region and a green lower region. In the pink region, "Pyruvate" is converted to "Lactate", a process labeled "PHIP P.L. inhibition" with a red arrow. In the green region, "Lactate" is converted back to "Pyruvate", a process labeled "NADH + H⁺ stimulation" with a green arrow. A central circular arrow indicates the continuous nature of the cycle, with small red and green icons representing the respective states or components.
