Development of superior nanotheranostic agents with indocyanine green-conjugated poly(styrene-*a/t*-maleic acid) nanoparticles for tumor imaging and phototherapy

Developing safe, high-quality theranostic agents for cancer treatment is of great clinical value. Here, we developed superior cancer nanotheranostic agents based on indocyanine green (ICG) conjugated poly(styrene-*a/t*-maleic acid) nanoparticles (NPs). Administration of the NPs plus the 808 nm laser irradiation led to excellent ablation of tumors.
