## Correction: High-level *ab initio* characterization of the OH + CH<sub>3</sub>NH<sub>2</sub> reaction

Balázs Gruber and Gábor Czakó  \*

Correction for 'High-level *ab initio* characterization of the OH + CH<sub>3</sub>NH<sub>2</sub> reaction' by Balázs Gruber et al., *Phys. Chem. Chem. Phys.*, 2024, **26**, 28543–28553, <https://doi.org/10.1039/d4cp01470g>.

After publication of our paper<sup>1</sup> on the benchmark *ab initio* stationary-point characterization of the OH + CH<sub>3</sub>NH<sub>2</sub> reaction, a relevant reference<sup>2</sup> came to our attention, which studied the same system with combined experimental and theoretical methods. The focus of the two studies was different, as ref. 1 provided a high-level *ab initio* description of the title reaction revealing new pathways leading to H atom as well as CH<sub>3</sub> and NH<sub>2</sub> radical formation, whereas ref. 2 reported a detailed kinetics investigation for the major H-abstraction channels. In the case of the H-abstraction processes, ref. 1 confirms and shows the uncertainty of the lower-level energy predictions of ref. 2. The two studies support and complement each other; thus, the interested reader may consult with both ref. 1 and 2 to get a more complete picture on the kinetics and mechanisms of the title reaction.

The Royal Society of Chemistry apologises for these errors and any consequent inconvenience to authors and readers.
