Correction for 'Wet spinning of sodium carboxymethyl cellulose-sodium caseinate hydrogel fibres: relationship between rheology and spinnability' by Lathika Vaniyan et al., Soft Matter, 2025, https://doi.org/ 10.1039/d4sm00705k.

The authors regret an error in Fig. 4 in the original manuscript. The correct version of Fig. 4 is as shown below.

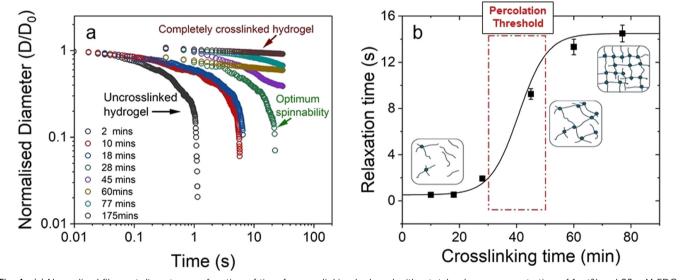

Fig. 4 (a) Normalised filament diameter as a function of time for crosslinking hydrogel with a total polymer concentration of 1 wt% and 20 mM EDC. Early filament thinning and breakage was observed in weakly crosslinked polymer while completely crosslinked polymers exhibited no filament formation. (b) Characteristic relaxation time (λ_E) from CaBER experiments as a function of crosslinking time obtained by fitting the exponential phase of CaBER data. Red dashed box is a visual guide to indicate the evidence of percolation threshold behaviour. Error bars represent n = 5. Fitted curves for extensional relaxation time, $\lambda_{\rm E}$, are shown in Fig. S8

The Royal Society of Chemistry apologises for these errors and any consequent inconvenience to authors and readers.
