Structure–property relationship study of bent-core mesogens with pyridine as central unit^{\dagger}

J.M. Marković,^{*a*} N.P. Trišović, ^{**a*} T. Tóth-Katona,^{*b*} M.K. Milčić,^{*c*} A.D. Marinković,^{*a*} C. Zhang,^{*d*} A.J. Jákli^{*b,d*} and K. Fodor-Csorba^{*b*}

Three series of bent-core mesogens having pyridine as central unit have been synthesized and characterized. A series of 2,6-diaminopyridine derivatives capable to form inter- and intramolecular hydrogen bonds exhibits very high melting points. A decrease in the polarity of the central part of the bent-core achieved by replacing the amide with ester linkages results in derivatives with lower melting points and formation of B2- and B7-like mesophases. The introduction of the olefinic groups, which connect the pyridine ring with the inner aromatic rings, helps to further lower the polarity of the central part in the five ring system and led to the formation of B1 and B7 phases. The phases have been determined by optical microscopy observations, differential scanning calorimetry (DSC) and confirmed by X-ray studies. The bending angles and polarity of the investigated five-ring systems have been calculated by density functional theory (DFT) method.

Introduction

Pyridine presents an attractive structural unit to be incorporated in organic materials, due to its aromaticity, strong electronwithdrawing character, high dipolar interaction and pH sensitivity. It can be used in materials for second harmonic generation, optical parametric oscillation and electro–optic modulation.¹⁻³ The electron deficiency and therefore, the electron affinity of the pyridine ring results in a higher resistance to oxidation and better electron transport properties, than most aromatic systems.⁴

In search for materials with a new chemical architecture, bent-core mesogens have attracted significant attention in recent years. Their unusual properties result from a polar smectic order, and the appearance of different types of structural chirality, although the constituent molecules may be achiral.⁵ Additionally, it has been demonstrated that this chirality can be switched in external electric fields.⁶ In spite of the very large activity in making a large variety of bent-core molecules, mostly with 1,3-disubstituted benzene as central unit, only a limited number of mesogens containing pyridine as central unit have been reported so far.^{7–9} Pyridine derivatives have also been used in mixtures with carboxylic acids to afford

hydrogen-bonded bent-shaped complexes which arrange in different mesophases. 10,11

In the present work we describe the synthesis and characterization of three series of symmetrical bent-core compounds with 2,6-disubstituted pyridine as central unit. These materials combine different linkages (amide (–CONH–), ester (–COO–), azomethine (–CH=NH–) and olefinic (–CH=CH–) with different chain lengths in the terminal chains. Because the compounds have a significant π -conjugation level, they are expected to have advanced electro-optical properties and potential application as organic electronic materials. The mesophases and transition temperatures of the investigated compounds have been further compared with the corresponding ones containing 1,3-disubstituted benzene as central unit which are available in the literature.

Results and discussion

Materials synthesis

Compounds **Ia–Ic** were obtained by following the synthetic protocol presented in Scheme 1. 2,6-Diaminopyridine (**1a**) reacted with 4-nitrobenzoyl chloride (**1b**) in pyridine to form N,N'-bis(4-nitrobenzoyl)-2,6-diaminopyridine (**1c**) according to

Scheme 1 Synthetic route for compounds Ia-Ic

the procedure described by Gamliel *et al.*¹² The nitro group was reduced to N,N'-bis(4-aminobenzoyl)-2,6-diaminopyridine (1d) by palladium-catalyzed hydrogenation. Finally, N,N'-bis[4-(4-n-alkyloxyphenyl)methyliminobenzoyl]-2,6-diaminopyridines

(**Ia–Ic**) were obtained from the condensation reaction between **Id** and the corresponding 4-*n*-alkoxybenzaldehydes (**1e–1g**) in DMSO. 4-*n*-Alkoxybenzaldehydes (**1e–1g**) were obtained by the already known methodology.¹³

The synthesis of di[4-(4-*n*-alkyloxyphenyliminomethyl)phenyl]pyridine-2,6-

dicarboxylates (**IIa-IIc**) is accomplished in three steps (Scheme 2). 2,6-Dipicolinic acid (**2a**) was converted into the corresponding chloride (**2b**) which further reacted with 4-hydroxybenzaldehyde (**2c**) to form the ester of dipicolinic acid (**2d**). Similarly to series **I**, compounds **IIa-IIc** were prepared by the condensation reaction between compound **2d** and the corresponding 4-*n*-alkoxyanilines (**2e**-**2g**). 4-*n*-Alkoxyanilines (**2e**-**2g**) were synthesized according to procedures described in the literature.¹⁴

The synthesis of 2,6-bis[2-(4-(4alkyloxybenzoyloxy)phenyl)ethenyl]pyridines (IIIa-IIIc) is presented Scheme 3. 2,6-Bis[2-(4in hydroxyphenyl)ethenyl]pyridine (3c) was prepared according to the procedure described by Bergmann and Pinchas.15 excess Condensation of 2,6-lutidine (3a) with 4hydroxybenzaldehyde (2c) in acetyc anhydride at the reflux

temperature afforded 2,6-bis[2-(4ethanoyloxyphenyl)ethenyl]pyridine (**3b**), base catalysed hydrolysis of which led to **3c**. In the final step, compounds **IIIa–IIIc** were obtained by acylation of **3c** with the corresponding 4-*n*-alkoxybenzoyl chlorides (**3g–3i**). Acid chlorides were firstly prepared by using the reaction between the corresponding 4-*n*-alkoxybenzoic acids (**3d–3f**) with thionyl chloride according to the known procedure.¹⁶

Mesomorphic properties

The chemical structures of the new bent-core molecules are summarized in Figure 1. Because the mesogens reported up to now contain in most cases a Schiff's base unit as linkage,¹⁷ azomethine-based compounds have been firstly synthesized in this study. It has already been demonstrated that the

positive effect on mesophase stabilisation of bent-core mesogens with a small increase of clearing temperatures.^{18,19} In this case the combination of the amide and azomethine groups has resulted in solids Ia-Ic with extremely high clearing temperatures (>300°C). This is due to the polarization, induced the electron-withdrawing pyridine ring, and the

intramolecular hydrogen bonding. In comparison with similar compounds IIa-IIc, but with ester linkages, we see that the less

polar ester linkage results in a decrease of the clearing points by about 50°C. Generally, the amide group confers structural rigidity due to its partial double bond character, which results in

higher clearing points of mesogens. The transition temperatures

and enthalpies of series II and III, obtained from DSC at a scan

rate of 5 K min⁻¹ in the second heating and cooling scans, are presented in Table 1. The DSC curves for series III are presented in Electronic Supplementary Information (Figure S1).

Due to the high temperature ranges, the azomethine compounds

decomposition inhibits the mesophase formation in the second

heating and cooling scans of the DSC experiments. In

disubstituted benzene as central unit²⁰, pyridine increases the

clearing point by almost 100°C. Compound IIa, with the

shortest terminal chain, is a crystalline solid without

mesomorphic properties, while compound **IIb** is more stable,

and its mesophase transition is clearly visible by POM during

cooling (Figure 2a), although this transition is not observed by

Compound IIc, with the longest terminal chain and the lowest

clearing point, exhibits mesomorphic properties, which are

observed both by DSC and POM (Figure 2b). The most stable

compounds with the lowest clearing temperatures (IIIa-IIIc)

have been obtained by combining the ester linkage with the

olefinic group, the least polar linkage used in this study. As also

expected, the clearing temperatures of compounds of series III

decrease with growing terminal chain length (Table 1).

Compound IIIa with the shortest terminal chain length does not

exhibit mesophase properties, while **IIIb** and **IIIc** do.

Figure 2 Optical photomicrographs (crossed polarizers) of compound a) IIb - T=257°C: formation of B7-like phase; b) IIc - T=241°C: formation of stripes resembling to the B2 phase

The identification of the mesophases has been aided by using Polarizing Optical Microscopy (POM). Compound IIb shows a monotropic mesophase, although no enthalpy change related to this transition was observed by DSC. On cooling from the isotropic phase, the growth of spiral birefringent domains, resembling to the B7 phase, is seen in a less than 1°C before it crystallized (see Figure 2a). Compound IIc shows an enantiotropic mesophase behaviour which is characterised by: i) the formation of two mesophases during heating, the transition between which is observed by the colour change (ESI Figure S2), ii) on cooling transition from isotropic to the first mesophase is presented by the formation of stripes resembling to the B2 phase (Figure 2b) also characterised by the narrow mesomorphic range.

On cooling from the isotropic liquid state, compound IIIb forms batonnets, which rapidly turn into branched lancets and finally coalesce into a structured mosaic-like texture with some spherulitic domains (Figure 3). This texture resembles to the columnar B1 phase. Compound IIIc forms helical filaments and circular domains of low and high birefringence on slow cooling from the isotropic phase. These spiral germs resemble to the B7 phase, Figure 4.

Figure 3 Optical photomicrographs (crossed polarizers are parallel to picture edges) of a 5 μ m thick film with planar anchoring of compound **IIIb**: a) T=177.5°C: formation of a columnar (B1) mesophase; b) T=163.8°C: crystal phase

X-ray studies

SAXS measurements were carried out on material IIIc that has a B7 phase between 159°C and 140°C. Summary of the results is shown in Figure 5. The 2-dimensional scattering pattern (Figure 5a) shows a main peak with a number of satellite peaks that correspond to a modulated smectic layers with periodicity of d=40.1Å, which is basically independent of the temperature. The layer modulation also shows up in the small q range where the 2nd to 7th harmonics of the 30 nm modulation periodicity appears with decreasing intensity. The corresponding q dependence of the integrated intensities is shown in Figure 5b. The modulation periodicity b is almost linearly increasing on cooling from 285Å at 158°C to 310Å at 146°C, as shown in Figure 5c. The angle γ between the layer and modulation periodicities is slightly increasing from 83.4° at 158°C to 84° at 146°C (see Figure 5d). All these behaviours are typical for the layer modulated SmCPmod phases of bent-core molecules.^{21,22} The main reason for the layer modulation is the polarization splay that leads to defects separating areas with different tilt directions that leads to regions with low packing efficiency. The need to improve the packing efficiently results in a

Figure 4 Optical photomicrographs (crossed polarizers along the edges) of a 5μ m thick film with planar anchoring of compound **IIIc**: a) T=162°C: formation of helical filaments and beaded filaments characteristic of a B7 phase; b) T=145°C: crystal phasetext of the article should go here with headings as appropriate

decrease of the tilt angle, which would violate the constant layer spacing, forcing the layer modulation. For this reason, the larger is the tilt angle, the larger is the layer modulation amplitude, and the elastic energy penalty. To decrease this energy penalty, the modulation's period should increase. The observation of the increasing modulation periodicity therefore maybe attributed to an increasing tilt angle toward lower temperatures. This is consistent with the model of Vaupotic *et al.*²³, if the elastic term K_p(θ) that stabilizes a finite splay of polarization increases with the tilt angle.

We attempted to do x-ray studies for **IIIb**, as well, but the transition temperatures were too high for the heat stage we have available in the synchrotron x-ray beam.

Electro-optical measurements

Electro-optical and polarization current measurements were carried out, but no electro-optical switching and no polarization peaks were observed up to 16V/micron for **IIIc** and 8V/micron for **IIIb**, respectively. Those fields also mark the upper limit of fields we could apply without electric breakdown.

Figure 5 Summary of the SAXS results on 3C in the B7 phase. (a) 2-D scattering pattern at 152 °C; (b) The corresponding q dependence of the scattered intensity; (c) The temperature dependence of the modulation period b; (d) the temperature dependence of the angle between the layer periodicity (d=40.1Å in the entire B7 phase range) and the modulation period b

Consequently we cannot tell whether the phases are ferreoelectric or antiferroelectric. We note that the absence of electro-optical and polarization switching is quite usual in B7 and B1 materials.

Quantum chemical calculations

Detailed density functional theory (DFT) calculations have been widely performed to shed light on the structure and polarity of bent-core mesogens.²⁴⁻²⁶ Herein, the molecular properties of the investigated compounds have been elucidated by the DFT B3LYP/6-311G(d,p) method. To reduce the computational effort, all calculations have been performed on five-ring systems bearing the methoxy groups instead of the terminal chains (Figure 6). Their conformational behaviour is primarily determined by the rotation around the bond between the central pyridine ring and the neighbouring atoms, whereas the rotations in the wings are considered to have only a small influence.

The calculations have shown that there are three stable conformers for each of these systems. The stable conformers of the cores of systems **I**, **II** and **III** are shown in Figure 7. For the system **I**, the most stable conformer (**IA**) is symmetric (with the C2 rotation axis and plane of reflection; C2v point group), whereas, when the bond between the pyridine ring and the amide group is rotated for 180° , a less symmetric conformer

(**IB**) is obtained (with the C2 rotation axis, but without the plane of reflection, C2 point group). The structure of a less stable conformer (**IC**) can be regarded as a combination of **IA** and **IB**, and it is asymmetric. The relative energies, dipole moment components (μ_x , μ_y , μ_z), modulus (μ), and corresponding angles for these three conformers are presented in Table 2.

Figure 6 Bent-core systems with bending angles, α_1 and α_2

Journal Name

of the molecule).

Table 2 shows that conformer IA is the most stable, due to formation of the intramolecular hydrogen bonds between the amide oxygen and hydrogen atoms from the pyridine ring. Those hydrogen bonds stabilise the structure by forming sixmember rings. The dipole moments are largest for the most stable conformer (IA). Conformer IB is almost non-polar, caused by the molecular symmetry (Table 2). The relative energy and dipole moment values of conformer IC are between those of conformers IA and IB. This is expected due to its

molecular structure (hydrogen bond is formed only in one part

IIC are between the conformers IIA and IIB.

and II, but with lower values (Table 2).

The structural characteristics of the conformers of system **II** are similar to the corresponding conformers of system **I** (Figure 7). Their relative energies and dipole moments are presented in Table 2. **IIA**, having intramolecular hydrogen bonds between the oxygen and hydrogen atoms, is the most stable. As these hydrogen bonds are weaker, the energy differences between the conformers are smaller than of the conformers of the system **I**. It can also be seen that the energy and dipole moment values of

System III has structural properties similar to the previous ones. The differences in energy between conformers IIIA, IIIB and IIIC are significantly smaller, because there is not any polar atom near the pyridine ring. This system is less polar, and

the electrostatic potential surface is much more neutral (green colour represents non-polar part of molecule; Figure 8). The dipole moment values have the same trend as for the systems **I**

We have found that the obtained values of the bending angle are in a good agreement not only with previous calculations for similar systems at different levels of theory²⁴⁻²⁶ but also with the bending angles obtained by single-crystal X-ray study of three-ring compounds which can be regarded as structural constituents of the investigated compounds. The highest/lowest bending angles α are found for the system I/II

(Table 2). Literature survey shows that N,N'-dibenzoyl-2,6-diaminopyridine²⁷ exhibits a bending angle of 123.5° which is in a good agreement with the value obtained for **IA** (Table 2).

 $a \alpha = (\alpha_1 + \alpha_2)/2$

^b Bending angle for N, N'-dibenzoyl-2, 6-diaminopyridine²⁷ is 123.5°

^c Bending angle for 2,6-dibenzylidinepyridine²⁸ is 95.3°

For the system II there is no adequate compound in the Cambridge Structural Database²⁹ for comparison, while 2,6-dibenzylidinepyridine²⁸ has a bending angle of 95.3° which is almost the same as obtained for the most stable conformer IIIA (94.3°). When compared to reported bending angles of bent-core liquid crystals containing benzene as central unit,²⁴ the bending angles of the investigated systems are narrow and it might be a reason the higher homologues form B7 mesophase.

DFT results demonstrate that the main contribution to the dipole moment of the systems I and III is due to the μ_y component. This is in agreement with the observation of Rama Krishnan *et al.*²⁴, who found that for small total dipole moments, μ_y yields the major contribution to μ , and the formation of smectic phase is favoured.

Conclusions

We have synthesized and characterized three series of bent-core mesogens having pyridine as central unit. The phases have been characterized by optical microscopy observations, differential scanning calorimetry (DSC) and confirmed by X-ray studies. A series I of 2,6-diaminopyridine derivatives capable to form inter- and intramolecular hydrogen bonds exhibits very high melting points and do not show mesomorphism. A decrease in the polarity of the central part of the bent-core achieved by replacing the amide with ester linkages results in derivatives (series II) with lower melting points and a formation of a very short undefined mesophase. The introduction of the olefinic groups, which connect the pyridine ring with the inner aromatic rings (series III), helps to further lower the polarity of the central part in the five ring system and led to the formation of a columnar (B1) phase in IIIb and a layer modulated smectic CP (B7) phases in case of **IIIc**. For this latter material the layer spacing and the modulation periodicities have been determined at the function of the temperature by small angle synchrotron xray measurements. The bending angles and polarity of the investigated five-ring systems have been calculated by density functional theory (DFT) method.

These results will guide the design and synthesis of new pyridine based bent-core liquid crystals with lower and wider mesophase ranges.

Experimental

Synthetic procedures

The reagents were purchased from Sigma Aldrich and were used without further purifications. All solvents were dried and distilled using general standard procedures. The chemical structures and the purities of the synthesized compounds were confirmed by melting points, elemental analysis, FT-IR, ¹H and ¹³C NMR spectra.

Preparation of N,N'-bis[4-(4alkyloxyphenyl)methyliminobenzoyl]-2,6-diaminopyridines (Ia– Ic)

N,N'-Bis(4-aminobenzoyl)-2,6-diaminopyridine (1d). A mixture of *N,N'-bis*(4-nitrobenzoyl)-2,6-diaminopyridine (1c, 8.00 g, 19.7 mmol) and 180 cm⁻³ of 70 % acetic acid was hydrogenated with 4.36 g of 5% Pd/C at 25 °C for 5 h. After filtration and evaporation, the product was suspended in 100 cm⁻³ of an aqueous solution of NaHCO₃ and stirred for 90 min.

The solid was filtered off and rinsed with plenty of water (yield 48.5 %). The melting points, FT-IR, ¹H and ¹³C NMR spectra of compound **1d** are in agreement with literature data and undoubtedly corroborate their structures.

N,N'-Bis[4-(4-alkyloxyphenyl)methyliminobenzoyl]-2,6-

diaminopyridines (**Ia-Ic**). To the solution of N,N'-bis(4aminobenzoyl)-2,6-diaminopyridine (**1d**) (3.00 mmol) in dimethyl sulfoxide (20 cm⁻³) was added dropwise a solution of respective 4-*n*-alkoxybenzaldehyde (**1e-1g**) (6.00 mmol) in DMSO (10 cm⁻³). The reaction was carried out at 90 °C for 24h. After cooling to the room temperature, ethanol was added dropwise and separated precipitate was filtered off and recrystallized from toluene.

N,*N*'-Bis[4-(4-pentoxyphenyl)methyliminobenzoyl]-2,6-

diaminopyridine (**Ia**) Yield 49 %; FTIR (KBr) $v = 3328, 2933, 2860, 1650, 1592, 1509, 1460, 1307, 1254, 1163, 848, 833, 794 cm⁻¹; ¹H NMR (500 MHz, CDCl₃): <math>\delta$ 0.95 (t, J = 7.0 Hz, 6H, CH₃), 1.38-1.50 (m, 8H, CH₂), 1.83 (quin, J = 7.0 Hz, 4H, CH₂), 4.03 (t, J = 6.5 Hz, 4H, CH₂), 6.99 (d, J = 9.0 Hz, 4H, Ar), 7.26 (d, J = 8.5 Hz, 4H, Ar), 7.82 (t, J = 8.0 Hz, 1H, Py), 7.85 (d, J = 8.5 Hz, 4H, Ar), 7.95 (d, J = 8.5 Hz, 4H, Ar), 8.12 (d, J = 8.0 Hz, 2H, Py), 8.37 (s, 2H, CH=N), 8.38 (s, 2H, NH-C=O) ppm; ¹³C NMR (125 MHz, CDCl₃): δ 13.99 (CH₃), 22.43 (CH₂), 28.14 (CH₂), 28.83 (CH₂), 68.25 (CH₂), 109.8 (Py), 114.8 (Ar), 121.2 (Ar), 128.4 (Ar), 156.1 (Py), 161.1 (CH=N), 162.4 (Ar), 165.0 (C=O) ppm. Elemental analysis, found: C, 73.93; H, 6.44; N, 9.97. Calc. for C₄₃H₄₅N₅O₄: C, 74.22; H, 6.52; N, 10.06%.

N,N'-Bis[4-(4-heptyloxyphenyl)methyliminobenzoyl]-2,6-

diaminopyridine (**Ib**) Yield 51 %; FTIR (KBr) v = 3325, 2925, 2855, 1650, 1590, 1509, 1459, 1305, 1252, 1162, 847, 833, 794 cm⁻¹; ¹H NMR (500 MHz, CDCl₃): δ 0.90 (t, J = 7.0 Hz, 6H, CH₃), 1.32-1.50 (m, 16H, CH₂), 1.82 (quin, J = 7.0 Hz, 4H, CH₂), 4.03 (t, J = 6.5 Hz, 4H, CH₂), 6.98 (d, J = 9.0 Hz, 4H, Ar), 7.26 (d, J = 8.5 Hz, 4H, Ar), 7.82 (t, J = 8.0 Hz, 1H, Py), 7.85 (d, J = 8.5 Hz, 4H, Ar), 7.94 (d, J = 8.5 Hz, 4H, Ar), 8.12 (d, J = 8.0 Hz, 2H, Py), 8.34 (s, 2H, CH=N), 8.37 (s, 2H, NH-C=O) ppm; ¹³C NMR (125 MHz, CDCl₃): δ 14.06 (CH₃), 22.59 (CH₂), 25.95 (CH₂), 29.02 (CH₂), 29.14 (CH₂), 31.75 (CH₂), 68.27 (CH₂), 109.7 (Py), 114.8 (Ar), 121.2 (Ar), 128.4 (Ar), 128.5 (Ar), 130.7 (Ar), 130.9 (Ar), 141.0 (Py), 149.8 (Ar), 156.1 (Py), 161.1 (CH=N), 162.4 (Ar), 165.0 (C=O) ppm. Preparation of di[4-(4-n-alkyloxyphenyliminomethyl)phenyl] pyridine-2,6-dicarboxylates (**Ha-IIc**)

Di(4-formylphenyl) pyridine-2,6-dicarboxylate (2d). To an icecold solution of 4-hydroxybenzaldehyde (2c, 20.8 g, 0,171 mol) in dry pyridine (100 cm⁻³) was added gradually a dipicolinic acid chloride (2b, 17.6 g, 0.095 mol). The reaction mixture was stirred at room temperature for 2 days, solvent was removed under reduced pressure, and the residue was rinsed with plenty of water. The crude product was purified by recrystallization from dimethylformamide, and the obtained yield was 62%. m.p.=220-222 °C; FTIR (KBr) v = 3063, 1761, 1683, 1597, 1573, 1395, 1308, 1233, 1208, 1171, 1156, 995, 907, 831, 752, 727, 565, 417 cm⁻¹; ¹H NMR (200 MHz, CDCl₃): δ 7.62 (d, J = 8.4 Hz, 4H, Ar), 8.07 (d, J = 8.6 Hz, 4H, Ar), 8.39 (t, J = 7.8Hz, 1H, Py), 8.58 (d, J = 7.8 Hz, 2H, Py), 10.05 (s, 2H, CHO) ppm; ¹³C NMR (50 MHz, CDCl₃): δ 123.1(Ar), 129.9 (Py), 131.5 (Ar), 134.6 (Ar), 140.1 (Py), 147.2 (Py), 155.4 (Ar), 162.6 (COO), 192.4 (CHO) ppm. Elemental analysis, found: C, 66.94; H, 3.53; N, 3.70. Calc. for C₂₁H₁₃NO₆: C, 67.20; H, 3.49; N, 3.73%.

Di[4-(4-n-alkyloxyphenyliminomethyl)phenyl] pyridine-2,6dicarboxylates (**Ha-IIc**). To the solution of di(4-formylphenyl) pyridine-2,6-dicarboxylate (**2d**) (3.00 mmol) in dimethyl sulfoxide (35 cm⁻³) was added dropwise a solution of respective 4-*n*-alkoxyaniline (**2e-2g**) (6.00 mmol) in DMSO (15 cm⁻³). The reaction was carried out at 90 °C for 24 h. After cooling to the room temperature, precipitate was filtered off and recrystallized from toluene.

pyridine-2,6-*Di*[4-(4-n-pentoxyphenyliminomethyl)phenyl] dicarboxylate (IIa) Yield 54 %; FTIR (KBr) v = 3067, 2957,2937, 2864, 1762, 1624, 1604, 1578, 1508, 1253, 1230, 1161, 1022, 867, 836, 553 cm⁻¹; ¹H NMR (500 MHz, CDCl₃): δ 0.91 $(t, J = 7.0 \text{ Hz}, 6\text{H}, C\text{H}_3), 1.37-1.48 \text{ (m, 8H, CH}_2), 1.86 \text{ (quin, } J$ = 7.0 Hz, 4H, CH₂), 4.16 (t, J = 6.5 Hz, 4H, CH₂), 7.17 (d, J =9.0 Hz, 4H, Ar), 7.68 (d, J = 9.5 Hz, 4H, Ar), 7.76 (d, J = 8.5Hz, 4H, Ar), 8.33 (d, J = 9.0 Hz, 4H, Ar), 8.84 (t, J = 8.0 Hz, 1H, Py), 8.97 (d, *J* = 8.0 Hz, 2H, Py), 9.13 (s, 2H, CH=N) ppm; ¹³C NMR (125 MHz, CDCl₃): δ 14.50 (CH₃), 24.07 (CH₂), 29.79 (CH₂), 30.38 (CH₂), 72.13 (CH₂), 119.1 (Ar), 124.6 (Ar), 125.6 (Ar), 127.8 (Py), 131.1 (Ar), 133.8 (Ar), 136.3 (Ar), 145.9 (Ar), 148.8 (Py), 159.6 (Py), 161.2 (Ar), 163.3 (C=O), 164.6 (CH=N) ppm. Elemental analysis, found: C, 73.73; H, 6.14; N, 5.95. Calc. for C₄₃H₄₃N₃O₆: C, 74.01; H, 6.21; N, 6.02%.

Di[4-(4-*n*-heptyloxyphenyliminomethyl)phenyl] pyridine-2, 6dicarboxylate (**IIb**) Yield 49 %; FTIR (KBr) v = 3068, 2953, 2935, 2858, 1762, 1623, 1604, 1578, 1508, 1254, 1231, 1162, 1148, 867, 835, 554 cm⁻¹; ¹H NMR (500 MHz, CDCl₃): δ 0.85 (t, <math>J = 7.0 Hz, 6H, CH₃), 1.28-1.51 (m, 16H, CH₂), 1.85 (quin, J = 7.0 Hz, 4H, CH₂), 4.16 (t, J = 6.5 Hz, 4H, CH₂), 7.16 (d, J = 9.0 Hz, 4H, Ar), 7.68 (d, J = 9.5 Hz, 4H, Ar), 7.75 (d, J = 9.0 Hz, 4H, Ar), 8.32 (d, J = 8.5 Hz, 4H, Ar), 8.83 (t, J = 8.0 Hz, 1H, Py), 8.96 (d, J = 8.0 Hz, 2H, Py), 9.12 (s, 2H, CH=N) ppm; ¹³C NMR (125 MHz, CDCl₃): δ 14.69 (CH₃), 24.35 (CH₂), 27.62 (CH₂), 30.71 (CH₂), 30.86 (CH₂), 33.69 (CH₂), 72.19 (CH₂), 119.1 (Ar), 124.6 (Ar), 125.6 (Ar), 127.8 (Py), 131.2 (Ar), 133.8 (Ar), 136.4 (Ar), 146.0 (Ar), 148.8 (Py), 159.6 (Py), 161.2 (Ar), 163.3 (C=O), 164.6 (CH=N) ppm. Preparation of 2,6-bis[2-(4-(4alkyloxybenzoyloxy)phenyl)ethenyl]pyridines (IIIa-IIIc)

2.6-Bis[2-(4-hydroxyphenyl)ethenyl]pyridine (**3c**) was synthesized by modifying a literature procedure.¹⁵ A mixture of 2,6-lutidine (3a, 2.7 g, 0.025 mol), 4-hydroxybenzaldehyde (2c, 9.2 g, 0.075 mol) and acetic anhydride (25 cm⁻³) was refluxed for 24 hours at 155 °C. The reaction mixture was poured into cold water (150 cm⁻³) and shaking until the excess acetic anhydride was completely hydrolyzed. The product was filtered, washed with water and recrystallized repeatedly from mixture of obtained ethanol. Α 2,6-bis-[2-(4ethanoyloxyphenyl)ethenyl]pyridine (**3b**, 1.5 g) and 0.75 mol dm⁻³ alcoholic potassium hydroxide (15 cm⁻³) was refluxed for ninety minutes and the reaction product precipitated from the clear solution as a voluminous powder by a current of carbon dioxide. 2,6-Bis[2-(4-hydroxyphenyl)ethenyl]pyridine (3c) was recrystallized from ethanol. Yield 32 %; m.p.>300 °C; FTIR (KBr) v = 3252, 1632, 1604, 1582, 1559, 1512, 1458, 1254,1208, 1173, 1004, 955, 830, 820, 801, 781, 740, 518 cm⁻¹; ¹H NMR (200 MHz, CDCl₃): δ 6.82 (d, J = 8.6 Hz, 4H, Ar), 7.09 (d, J = 16.2 Hz, 2H, CH=CH), 7.31(d, J = 7.6 Hz, 2H, Py), 7.53 (d, J = 8.4 Hz, 4H, Ar), 7.67 (d, J = 15.8 Hz, 2H, CH=CH),7.69 (t, J = 7.7 Hz, 1H, Py), 9.71 (s, 2H, OH) ppm; ¹³C NMR (50 MHz, CDCl₃): δ 115.9 (Ar), 120.1 (Py), 125.3 (CH=CH), 127.8 (Ar), 128.8 (Ar), 132.5 (CH=CH), 137.4 (Py), 155.4 (Py), 158.2 (Ar) ppm. Elemental analysis, found: C, 79.69; H, 5.47; N, 4.39. Calc. for C₂₁H₁₇NO₂: C, 79.98; H, 5.43; N, 4.44%.

2,6-Bis[2-(4-(4-alkyloxybenzoyloxy)phenyl)ethenyl]pyridines

(IIIa-IIIc). To an ice-cold solution of 2,6-bis[2-(4-hydroxyphenyl)ethenyl]pyridine (3c) (3.00 mmol) in dry pyridine (30 cm⁻³) was added slowly respective 4-*n*-alkoxybenzoyl chloride (3g-3i) (6.00 mmol). The reaction was carried out at room temperature for 2 days. The product was filtered off and recrystallized from acetone and toluene successively.

2,6-Bis[2-(4-(4-pentoxybenzoyloxy)phenyl)ethenyl]pyridine (IIIa) Yield 46 %; FTIR (KBr) v = 2957, 2935, 2860, 1728, 1606, 1579, 1561, 1510, 1458, 1276, 1256, 1212, 1164, 1069, 762 cm⁻¹; ¹H NMR (500 MHz, CDCl₃): δ 0.95 (t, J = 7.0 Hz, 6H, CH₃), 1.38-1.50 (m, 8H, CH₂), 1.83 (quin, J = 7.0 Hz, 4H, CH₂), 4.04 (t, J = 6.5 Hz, 4H, CH₂), 6.97 (d, J = 9.0 Hz, 4H, Ar), 7.18 (d, J = 16.0 Hz, 2H, CH=CH), 7.24 (d, J = 8.5 Hz, 4H, Ar), 7.27 (d, J = 7.5 Hz, 2H, Py), 7.64 (t, J = 8.0 Hz, 1H, Py), 7.66 (d, J = 8.5 Hz, 4H, Ar), 7.73 (d, J = 16.0 Hz, 2H, CH=CH), 8.15 (d, J = 8.5 Hz, 4H, Ar) ppm; ¹³C NMR (125 MHz, CDCl₃): δ 13.98 (CH₃), 22.41 (CH₂), 28.11 (CH₂), 28.77 (CH₂), 68.30 (CH₂), 114.3 (Ar), 120.5 (Ar), 121.4 (Py), 122.1 (Ar), 128.1 (Ar), 128.3 (CH=CH), 132.0 (CH=CH), 132.3 (Ar), 134.4 (Ar), 137.0 (Py), 151.0 (Ar), 155.3 (Py), 163.6 (Ar), 164.8 (C=O) ppm. Elemental analysis, found: C, 77.41; H, 6.48; N, 1.98. Calc. for C₄₅H₄₅NO₆: C, 77.67; H, 6.52; N, 2.01%.

2,6-Bis[2-(4-(4-heptyloxybenzoyloxy)phenyl)ethenyl]pyridine

(IIIb) Yield 43 %; FTIR (KBr) v = 2929, 2856, 1727, 1606,1579, 1562, 1510, 1460, 1257, 1212, 1164, 1073, 762 cm⁻¹; ¹H NMR (500 MHz, CDCl₃): δ 0.90 (t, J = 7.0 Hz, 6H, CH₃), 1.32-1.50 (m, 16H, CH₂), 1.82 (quin, J = 7.0 Hz, 4H, CH₂), 4.04 (t, J = 6.5 Hz, 4H, CH₂), 6.97 (d, J = 8.5 Hz, 4H, Ar), 7.18 (d, J =16.0 Hz, 2H, CH=CH), 7.24 (d, J = 8.5 Hz, 4H, Ar), 7.27 (d, J = 7.5 Hz, 2H, Py), 7.64 (t, J = 7.5 Hz, 1H, Py), 7.66 (d, J = 8.5 Hz, 4H, Ar), 7.73 (d, J = 16.5 Hz, 2H, CH=CH), 8.15 (d, J =9.0 Hz, 4H, Ar) ppm; ¹³C NMR (125 MHz, CDCl₃): δ 14.06 (CH₃), 22.58 (CH₂), 25.92 (CH₂), 29.01 (CH₂), 29.08 (CH₂), 31.73 (CH₂), 68.32 (CH₂), 114.3 (Ar), 120.5 (Ar), 121.4 (Py), 122.1 (Ar), 128.1 (Ar), 128.3 (CH=CH), 132.0 (CH=CH), 132.3 (Ar), 134.4 (Ar), 137.0 (Py), 151.0 (Ar), 155.3 (Py), 163.6 (Ar), 164.8 (C=O) ppm. Elemental analysis, found: C, 78.02; H, 7.04; N, 1.84. Calc. for C₄₉H₅₃NO₆: C, 78.27; H, 7.10; N, 1.86%.

2,6-Bis[2-(4-(4-dodecyloxybenzoyloxy)phenyl)ethenyl]pyridine (IIIc) Yield 51 %; FTIR (KBr) v = 2956, 2919, 2850, 1726,1609, 1579, 1564, 1509, 1459, 1288, 1253, 1212, 1196, 1170, 761 cm⁻¹; ¹H NMR (500 MHz, CDCl₃): δ 0.89 (t, J = 7.0 Hz, 6H, CH₃), 1.27-1.50 (m, 36H, CH₂), 1.82 (quin, J = 7.0 Hz, 4H, CH₂), 4.04 (t, J = 6.5 Hz, 4H, CH₂), 6.97 (d, J = 9.0 Hz, 4H, Ar), 7.18 (d, J = 16.0 Hz, 2H, CH=CH), 7.24 (d, J = 8.5 Hz, 4H, Ar), 7.27 (d, J = 7.5 Hz, 2H, Py), 7.64 (t, J = 7.5 Hz, 1H, Py), 7.66 (d, J = 8.5 Hz, 4H, Ar), 7.73 (d, J = 16.5 Hz, 2H, CH=CH), 8.15 (d, J = 9.0 Hz, 4H, Ar) ppm; ¹³C NMR (125 MHz, CDCl₃): δ 14.10 (CH₃), 22.67 (CH₂), 25.97 (CH₂), 29.08 (CH₂), 29.34 (CH₂), 29.35 (CH₂), 29.54 (CH₂), 29.57 (CH₂), 29.62 (CH₂), 29.64 (CH₂), 31.90 (CH₂), 68.33 (CH₂), 114.3 (Ar), 120.5 (Ar), 121.4 (Py), 122.1 (Ar), 128.1 (Ar), 128.3 (CH=CH), 132.0 (CH=CH), 132.3 (Ar), 134.4 (Ar), 137.0 (Py), 151.0 (Ar), 155.3 (Py), 163.6 (Ar), 164.9 (C=O) ppm. Elemental analysis, found: C, 79.15; H, 8.20; N, 1.56. Calc. for C₅₉H₇₃NO₆: C, 79.42; H, 8.25; N, 1.57%.

Physical investigations

To confirm the chemical structure of the synthesized compounds the following analytical methods were applied. Fourier-transform infrared spectra (FT-IR) were recorded on a Bomem MB 100 spectrophotometer (v_{max} in cm⁻¹) on KBr pellets. ¹H and ¹³C nuclear magnetic resonance (NMR) spectra were recorded on a Varian Gemini 200 spectrometer on 200 MHz or Bruker AVANCE on 500 MHz, whereas ¹³C spectra were recorded on 50 or 125 MHz. NMR spectra were recorded in CDCl₃, or DMSO-*d*₆, using TMS as the internal standard (chemical shift δ in ppm). Elemental analysis was realized

using an Elemental Vario EL III microanalyzer, their results were found to be in good agreement ($\pm 0.3\%$) with the calculated values.

The temperatures and enthalpies of the phase transitions were determined by differential scanning calorymetry (DSC) on METTLER FP89 using cooling and heating runs at a rate of 5° C min⁻¹. The samples of 3–5 mg were sealed in aluminium pans.

For electro-optical investigations the materials were filled in home made 5 μ m thick films with transparent indium tin oxide (ITO) electrodes and antiparallel rubbed polyimide alignment layer. The electro-optical measurements were done using an Olympus BX51 microscope equipped with 90° crossed polarizers, an HCS402 hot stage from Instee Inc., and a digital camera (14.2 Mp Color Mosaic Model from Diagnostic Instruments, Inc.). The images were captured using a Hitachi CCD camera under transmitted light between crossed polarizers. The electric signals were applied by a HP function generator and FLC voltage amplifier.

Small angle x-ray scattering (SAXS) measurements were performed at the National Synchrotron Light Source (NSLS, beam line X6B) of Brookhaven National Lab. The materials were filled into 1 mm diameter quartz x-ray tubes, which were then mounted into a custom-built aluminum cassette that allowed x-ray detection with $\pm 13.5^{\circ}$ angular range. The cassette fits into a standard hot stage (Instec model HCS402) that allowed temperature control with $\pm 0.05^{\circ}$ C precision. The stage also included two cylindrical neodymium iron boron magnets that supplied a magnetic induction of B=1.5T perpendicular to the incident x-ray beam. Two-dimensional SAXS images were recorded on a Princeton Instruments 2084 \times 2084 pixel array CCD detector. The beamline was configured for a collimated beam (0.2mm x 0.3 mm) at energy 16 keV (0.775 Å). Details of the experimental conditions are described elsewhere.³⁰

Computational details

The information related to molecular conformation, bending angle and dipole moment of the investigated mesogens were elucidated by the density functional theory (DFT) using the 6-311G(d,p) basis set. All calculations were done with Gaussian03 software.³¹

Textual abstract

The synthesis and characterization of pyridine bent-core liquid crystals are reported. Some compounds exhibit B1 and B7 mesophase. Lower and wider mesophase ranges are achieved by decreasing polarity of linkers between the pyridine ring and the inner aromatic rings, and increasing length of terminal chains.
