## Accepted Manuscript

This is an Accepted Manuscript, which has been through the Royal Society of Chemistry peer review process and has been accepted for publication.

Accepted Manuscripts are published online shortly after acceptance, before technical editing, formatting and proof reading. Using this free service, authors can make their results available to the community, in citable form, before we publish the edited article. We will replace this Accepted Manuscript with the edited and formatted Advance Article as soon as it is available

You can find more information about Accepted Manuscripts in the Information for Authors.

Please note that technical editing may introduce minor changes to the text and/or graphics, which may alter content. The journal's standard Terms \& Conditions and the Ethical guidelines still apply. In no event shall the Royal Society of Chemistry be held responsible for any errors or omissions in this Accepted Manuscript or any consequences arising from the use of any information it contains.

# $\mathrm{C}_{5}$-curcuminoid-4-aminoquinoline based molecular hybrids: Design, synthesis and mechanistic investigation of anticancer activity

DOI: 10.1039/b000000x

#### Abstract

The privileged scaffolds of curcumin and 4-aminoquinolines are extensively used in the design and synthesis of biodynamic agents having remarkable efficacy against diseases like cancer and malaria. Therefore, we anticipated that covalent hybridization of these two pharmacophore via triazole linker may lead to molecules with better anticancer activity. The synthesized hybrid compounds were ${ }_{10}$ tested for their anti-cancer activity on 60 human cancer cell lines, which represent diverse histologies. Our study has identified a set of these hybrids that showed excellent growth inhibition at nano-molar concentrations. The mechanistic investigations through a series of assays showed apoptotic induction as a cause for their displayed anticancer activity.

## 1. Introduction

Cancer is a leading cause of death worldwide, accounting for 7.6 ${ }_{15}$ million deaths in 2008 and expected to cross the figure of around 13 million deaths by 2030. About 70\% cancer related deaths are mainly due to lung, colon, liver, stomach and breast cancers. ${ }^{1,2}$ It is well established that there is no single treatment of cancer and patients often receive a combination of therapies and palliative ${ }_{20}$ care, such as surgery, radiation, immunotherapy, chemotherapy or gene therapy depending on the type and stage of the cancer, health status, age and personal characteristics. ${ }^{3}$ Anticancer drugs such as alkylating agents, ${ }^{4-8}$ antimetabolites, ${ }^{9-11}$ plant alkaloids, ${ }^{1 / 2}$ ${ }^{15}$ topoisomerase inhibitors ${ }^{16,17}$ and cytotoxic antibiotics ${ }^{18}$ have 25 been used extensively in chemotherapy. Among these, natural products show good promises in the development of anticancer molecules ${ }^{19,20}$ and curcumin is one such natural product which has been extensively studied over the past few decades. ${ }^{21}$ These studies revealed that curcumin shows anticancer activity against ${ }_{30}$ prostate cancer, ${ }^{22}$ cervical cancer, ${ }^{23}$ colorectal carcinoma, ${ }^{24}$ leukemia ${ }^{25}$ and human breast cancer cells. ${ }^{26}$ The clinical use of curcumin has been hampered due to its poor solubility, absorption, bioavailability and rapid metabolism. ${ }^{27-30}$ The pharmacokinetic studies reveals that the $\beta$-diketone functionality 35 of curcumin is a substrate for liver aldoketo reductases and this may be one of the reasons for its rapid in vivo metabolism. ${ }^{31}$ To overcome these limitations, several approaches have been explored and replacement of central diketo functionality with mono carbonyl has resulted many compounds with improved 40 anticancer activity, pharmacokinetic properties and bioavailability. ${ }^{32-36}$

In recent years, concept of molecular hybrids has gained considerable importance due to the problem of drug resistance and it is anticipated that these 'dual-drugs' or 'double-drugs' 45 synthesised by covalent hybridization of two or more pharmacophores may solve the problem of drug resistance. ${ }^{37-39}$ In this scenario, the synthesis of molecular hybrids by conjugating $\mathrm{C}_{5}$-curcuminoid pharmacophore with other biologically active entities, especially those which are known for their anticancer ${ }_{50}$ activity may exhibit better anticancer properties in comparison to none conjugate counterparts. ${ }^{40}$ Quinoline is one such privileged pharmacophore that possess an array of biological activities
including antimalarial, anti-proliferative and antitumor activity. Among the many synthesized molecules containing quinoline 55 scaffold, camptothecin and its synthetic derivatives topotecan and irinotecan are well known for their antitumor activity and these compounds display their anticancer activity by inhibiting DNA enzyme topoisomerase I (Fig. 2). ${ }^{41}$ So, based on these observations and in continuation of our efforts of developing 60 structurally diverse molecules of medicinal importance, ${ }^{42-45}$ we designed molecular hybrids by clubbing together $\mathrm{C}_{5}$ curcuminoids and quinoline nucleus by covalently linking it through 1,2,3-triazole ring. Our rational for choosing 1,2,3triazole linker is based on the fact that triazole shows favourable ${ }_{55}$ physiochemical properties in biological system and can be conveniently synthesized by click chemistry. ${ }^{46,47}$

## 2. Results and Discussion

## so 2.1 Chemistry

The targeted $\mathrm{C}_{5}$-curcuminoid-4-aminoquinoline based hybrids ( $\mathbf{7 a}$-g and $\mathbf{8 a - g}$ ) were synthesized as depicted in scheme 1. To start with, firstly commercially available 4,7-dichloroquinoline

## (1) was reacted with linear chain aminoalcohols under neat conditions to yield 4 -aminoquinolines with a free hydroxyl group

at the terminal position (2a-b) in excellent yield.

$6 b, n=2$

Scheme 1(Reagents and conditions): (a) Aminoalcohol, neat, $130-150{ }^{\circ} \mathrm{C}$, under $\mathrm{N}_{2}, 10-12 \mathrm{~h}$; (b) $\mathrm{MsCl}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{THF}, 0{ }^{\circ} \mathrm{C}-\mathrm{rt}$, under $\mathrm{N}_{2}, 1 \mathrm{~h}$; (c) $\mathrm{NaN} \mathrm{N}_{3}, \mathrm{DMF}$, $4050^{\circ} \mathrm{C}$, 4-5 h; (d) Propargyl bromide, $\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{CHCl}_{3}, \mathrm{H}_{2} \mathrm{O}$, rt, 5-6 h; (e) t-Butanol: $\mathrm{H}_{2} \mathrm{O}(1: 1), \mathrm{CuSO}_{4} .5 \mathrm{H}_{2} \mathrm{O}$, sodium ascorbate, $40-60{ }^{\circ} \mathrm{C}$, 3 h ; (f) Substituted benzaldehydes, $20 \%$ aq. NaOH (w/v), ethanol, rt, 4-5 h.

The free hydroxyl group was chemoselectively $O$-mesylated by literature method ${ }^{45}$ using mesyl chloride and triethylamine as a base to yield mesylated 4 -aminoquinolines (3a-b). Subsequently, the mesylated products ( $\mathbf{3 a - b}$ ) were converted into corresponding 5 azides (4a-b) using sodium azide as nucleophile and DMF as solvent at $50^{\circ} \mathrm{C}$. These azides (4a-b) were reacted with 1-(prop2 -yn-1-yl)piperidin-4-one (5) by click chemistry using standard protocols of sodium ascorbate and copper sulfate as catalyst and an equimolar ratio of water and $t$-butanol as solvents to yield 10 1,2,3-triazole linker contained intermediates ( $\mathbf{6 a - b}$ ). In the final step, the intermediates ( $\mathbf{6 a - b}$ ) were subjected to aldol condensation with substituted benzaldehydes in the presence of NaOH as base in ethanol to get the final targeted products (7a-g and $\mathbf{8 a - g}$ ). It may be noted that, the intermediate compound $1-$ 15 (prop-2-yn-1-yl)piperidin-4-one (5) was synthesized via nucleophilic substitution reaction between 4-piperidone hydrochloride monohydrate and propargyl bromide in the presence of anhydrous $\mathrm{K}_{2} \mathrm{CO}_{3}$ in the biphasic system $\left[\mathrm{CHCl}_{3}: \mathrm{H}_{2} \mathrm{O}\right.$ (1:1)] at room temperature in good yield.

## ${ }_{20}$ 2.2 Biological studies

### 2.2.1 Anticancer activity

In the present study, a series of $\mathrm{C}_{5}$-curcuminoid-4aminoquinoline based molecular hybrids (7a-g and 8a-g) were synthesized and in order to explore the therapeutic potential of 25 these hybrids, a representative subset of these compounds was screened for their growth inhibitory activity and cytotoxicity against 60 different human cancer cell lines. The screening was carried out by following a standard procedure described earlier. ${ }^{48}$ In the screening panel, 60 human cancer cell lines are organized ${ }_{30}$ into nine subpanels representing diverse histology's: leukemia, melanoma, and cancers of lung, colon, kidney, ovary, breast, prostate, and central nervous system. The cells were grown in supplemented RPM1 1640 medium for 24 h . The test compounds were dissolved in DMSO and incubated with cells at five

35 concentrations with 10 -fold dilutions, the highest concentration being $10^{-4} \mathrm{M}$ and the others $10^{-5}, 10^{-6}, 10^{-7}$, and $10^{-8} \mathrm{M}$. The assay was terminated by the addition of cold trichloroacetic acid, and the cells are fixed and stained with sulforhodamine B. The bound stain was solubilized, and the absorbance was read on an 40 automated plate reader. The cytostatic parameter i.e. $50 \%$ growth inhibition $\left(\mathrm{GI}_{50}\right)$ was calculated from time zero, control growth, and the five concentration level absorbance. The cytotoxic parameter i.e. inhibitory concentrations $\left(\mathrm{LC}_{50}\right)$ represent the average of two independent experiments. The screening process
45 was a two-stage process started with the evaluation of compound against the 60 human tumor cell lines with a single dose of 10.0 $\mu \mathrm{M}$, which was carried out by following the same protocol as for five dose screening. Only the compound which showed more than $60 \%$ of growth inhibition in at least 8 tumor cell lines was ${ }_{50}$ selected for further testing and the others were assumed inactive. The initial testing at a single dose of $10 \mu \mathrm{M}$ found compounds 7 d and $7 \mathbf{f}$ causing significant inhibition of several cell lines. Both compounds were further tested for dose response effect at five concentration levels ( $100,10,1.0,0.1$ and $0.01 \mu \mathrm{M}$ ). The mean ${ }_{55}$ values for $\mathrm{GI}_{50}$ and $\mathrm{LC}_{50}$ on all 60 cell lines are given in Table 1. Additional data for both compounds i.e. one dose results, mean graphs, drug response curves, five dose mean graphs and $\mathrm{GI}_{50}$ and $\mathrm{LC}_{50}$ values are given in the supplementary information. The dose response curves of $\mathbf{7 d}$ and $\mathbf{7 f}$ for all 60 cell lines are illustrated in Fig. 3.

Mean graph patterns reflect the mechanism of action in vitro. The graph of a dose-response curve helps in determining effective concentrations of an agent. Fig. $3 \& 4$ shows the doseresponse curves for each of the nine cancer panels. These graphs
${ }_{65}$ display the effective variations in sensitivity of cell lines in different cancer panels. As can be seen from these graphs, both compounds have a similar effect on the cell lines suggesting that the class of molecular hybrid apparently attack the same protein target.

Table 1: Antitumor activity $\left(\mathrm{GI}_{50} / \mu \mathrm{M}\right)^{a}$ and toxicity $\left(\mathrm{LC}_{50} / \mu \mathrm{M}\right)^{b}$ data of compounds $\mathbf{7 d}$ and $\mathbf{7 f}$ selected for five dose studies for theNCI60-cell line screen.

(b)

Fig. 3: (a) Dose response curves for individual cancer panel (Compound 7d); (b) Dose response curves for individual cancer panel (Compound 7f)
2.2.2 Mechanism of action study: In the initial screening compounds 7d and 7f showed significant effect on the colon cancer panel. Therefore, to understand the mode of their action, subsequent studies were carried out using COLO205 cell lines.
5 These cells provide a system for careful analysis of the immunobiology and antigenicity of human adenocarcinoma of the colon without the complications of histocompatibility differences. The details of our experiments are given below.

### 2.2.2.1 Annexin V

${ }_{10}$ Annexin V screening was performed to assess apoptotic cells. The values obtained from the percentage of apoptotic cells were $97 \%$ for compound $7 \mathbf{f}$ and $63.5 \%$ for compound 7d. Results obtained revealed statistically significant $(\mathrm{P}<0.05)$ activity when compared to the negative control suggesting apoptosis activity
15 (Fig. 4). Compound 7d presented $30 \%$ of cells at the late apoptotic stage (Fig. 5) whereas compound $7 \mathbf{f}$ presented a majority of cells ( $79 \%$ ) at an early apoptotic stage. These results indicated that both compounds are apoptosis inducers although with varying degrees since there are differences between both
20 experimental compounds indicated by the early/late apoptotic stages.

Fig.4: Annexin V

25
Fig. 5: Distribution of apoptotic cells

### 2.2.2.2 DNA Fragmentation

Cells with fragmented DNA are characteristic of an apoptotic death mechanism. This event is measured as a confirmatory event in the apoptotic pathway. Our experimental data present a 30 statistically significant ( $\mathrm{P}<0.05$ ) activity of both experimental compounds. Compound $7 \mathbf{f}$ presented $47 \%$ of cells with fragmented DNA while it was $54 \%$ in the case of compound 7 d . These results are significant when compared to the negative control which presented $8.5 \%$ of cells with fragmented DNA ${ }_{35}$ (Fig. 6).

### 2.2.2.3 Caspase activation

(a) Caspase 3 and 7: The activation of effector caspases is one of the key late events in apoptosis. Our test compounds demonstrated high activation of these caspases. Compound $7 \mathbf{f}$ ${ }_{40}$ gave the highest activation at $98 \%$ of cells while compound 7d presented $59.5 \%$ of cells with activated caspases (Fig. 7). Although both compounds caused significant activation, results of compound $7 \mathbf{f}$ were comparable ( $\mathrm{P}<0.05$ ) to the camptothecin positive control. A key difference between these two compounds ${ }_{45}$ is the apoptotic stage after the 24 hour exposure. Compound $7 \mathbf{f}$ exposed cells were present at the early apoptotic stage while the majority of compound $\mathbf{7 d}$ exposed cells are at the late apoptotic stage (Fig. 8).

Fig.6: DNA Fragmentation on COLO 205 cells

Fig.7: Caspase 3 and 7 activation.

(b) Caspase 8: Caspase 8 activation is one of the key effects in extrinsic mechanism apoptosis. ${ }^{49}$ Our experiments presented varied activity among the test compounds. Compound 7f presented the highest activation at $86.5 \%$ of cells with activated 5 caspase 8 (Fig. 9). The majority of these cells were at the early apoptotic stage (Fig. 10). Compound 7d presented moderate induction of caspase 8 at $41 \%$ with the majority of apoptotic cells at the late apoptotic stage. Both compounds caused higher induction than the camptothecin positive control.

Caspase 8

10
Fig. 9: Caspase 8 activation.

Fig. 10: Caspase 8 apoptotic cell distribution
15 (c) Caspase 9: Caspase 9 activation is characteristic of the intrinsic apoptotic pathway. ${ }^{50}$ Our compounds caused distinct activation of caspase 9 . Compound $7 \mathbf{f}$ caused the highest activation of caspase 9 with an average at $91.5 \%$ of cells (Fig. 11) with apoptotic cells at the early apoptotic stage (Fig. 12). ${ }_{20}$ Compound 7d did not activate caspase 9 in a significant manner suggesting an extrinsic mechanism.

Compound

## 3. Conclusion

We have synthesized a new class of $\mathrm{C}_{5}$-curcuminoid-4aminoquinoline molecular hybrid and a detailed screening of representative compounds has demonstrated their potential as 30 anticancer agents. Mechanistic studies of test compounds 7d and $7 f$ presented positive annexin $V$ staining, which is characteristic of apoptotic cell death after chemical insult. ${ }^{51}$ After initial screening, we decided to explore further markers for apoptosis to determine any additional mechanistic insights, and tested for ${ }_{35}$ DNA fragmentation which is another hallmark of apoptosis. This nuclease mediated event occurs after activation of DNase by effector caspases. ${ }^{52}$ Our results confirmed that indeed both compounds ( $\mathbf{7 d}$ and $\mathbf{7 f}$ ) cause apoptotic cell death since the cells exposed to them presented fragmentation of DNA and activation
40 of effector caspases in a significant manner. Interestingly, both compounds caused activation of caspase 8 while compound $7 \mathbf{f}$ also caused activation of caspase 9 . This simultaneous activation of both extrinsic and intrinsic apoptosis has been observed in heterocyclic compounds such as quinoline derivatives ${ }^{53}$ where an
${ }_{45}$ increase in the pro apoptotic protein Bax causes the release of cytochrome C activation of caspase 9 and 8 followed by the effector caspase 3. These results have established the anticancer activity of our newly synthesized molecular hybrids which merits for their development as potential drug agents.

## ${ }_{50}$ 4. Experimental Section

### 4.1 Chemistry

### 4.1.1. Instrumentation and Chemicals

All the starting materials used in the synthesis were purchased from Sigma-Aldrich (Bangalore, Karnataka, India) and were used
55 as such. Thin layer chromatography (E. Merck Kieselgel $60 \mathrm{~F}_{254}$ ) was used to monitor the progress of the reactions. The synthesized compounds were purified using the silica gel column. Distilled solvents were used for purification purposes. Melting points were measured in open capillary tubes on an ERS 60 automated melting point apparatus. IR spectra were recorded using a Perkin-Elmer FT-IR spectrophotometer and the values are expressed as $\lambda_{\text {max }} \mathrm{cm}^{-1}$. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on Jeol Spectrospin spectrometer at 400 MHz and 100 MHz respectively using TMS as an internal standard. The
${ }_{65}$ chemical shift values are recorded on $\delta$ scale, and the coupling constants (J) are in Hz. Mass spectral data were recorded on a Jeol-AccuTOF JMST100LC and micromass LCT Mass Spectrometer/Data system. Elemental analyses were performed on a Carlo Erba Model EA-1108 elemental analyzer and data of ${ }_{70} \mathrm{C}, \mathrm{H}$ and N are within $\pm 0.4 \%$ of calculated values.

Procedure for synthesis of 1-((1-(2-((7-chloroquinolin-4-yl)amino)ethyl)-1H-1,2,3-triazol-4-yl)methyl) piperidin-4-one (6a) and similar compound (6b):

To a stirred solution of compound $5(2 \mathrm{~g}, 14.59 \mathrm{mmol})$ and 5 compound $4 \mathrm{a}(3.60 \mathrm{~g}, 14.59 \mathrm{mmol})$ in $t$-butanol $(40 \mathrm{~mL})$ at room temperature, a solution of $\mathrm{CuSO}_{4} .5 \mathrm{H}_{2} \mathrm{O}(0.7279 \mathrm{~g}, 2.918 \mathrm{mmol})$ and sodium ascorbate $(1.1566 \mathrm{~g}, 5.836 \mathrm{mmol})$ in water $(40 \mathrm{~mL})$ was added. The temperature was increased to $40-60^{\circ} \mathrm{C}$ and the reaction mixture was stirred for 3-4 h. After completion of ${ }_{10}$ reaction as evident by TLC, $\mathrm{CHCl}_{3}(100 \mathrm{~mL})$ was added and organic layer was washed with water $(3 \times 500 \mathrm{~mL})$ and finally with brine ( 200 mL ). The organic layer was then dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and excess of solvent was evaporated to dryness to get the pure product. ### 4.2 Anticancer screening

The anticancer screening was carried out following the procedure described earlier. ${ }^{48}$

### 4.3 Mechanism of action studies

## Materials and methods

## Compound Stock Solutions

Compounds were prepared at a 3 mM stock concentration in
${ }_{5}$ DMSO culture grade under sterile conditions. All experiments were done at the $10 \mu \mathrm{M}$ dose as determined by the NCI 60 cell line screening protocol previously performed for these compounds.

## Cell culture

${ }_{10}$ The cell line used in this study was COLO-205 human colorectal adenocarcinoma
(ATCC CCL-222). These cells were maintained in RPMI 1640 (ATCC, Manassas VA) supplemented with $10 \%$ fetal bovine serum (ATCC). Cultures were maintained at $37^{\circ} \mathrm{C}$ with 15 humidified atmosphere of $95 \%$ air $5 \% \mathrm{CO}_{2}$.

## Annexin $V$

The annexin V assay has been used as an imaging tool for the detection and indication of phosphatidylserine (PS) on the surface of cells; a key event in apoptotic cells. ${ }^{54}$ Approximately $3 \times 10^{6}$ ${ }_{20}$ cells were treated with the $\mathrm{IC}_{50}$ dose of each compound and controls (vehicle DMSO and camptothecin). After exposure, cells were stained with annexin V conjugate, andpropidium iodide (Biotium, Hayward, CA). Samples where then analysed using the Nucleo Counter NC3000 (Chemometec, Allerød, Denmark). A
25 one way ANOVA was performed. If significant results were found in the ANOVA, a Post Hoc Test Tukey was also performed.

## DNA Fragmentation

DNA Fragmentation as an apoptosis marker is a commonly used
${ }_{30}$ assay in drug-cell interaction studies. ${ }^{55,56}$ This nuclease mediated event can be quantified using DNA content and measuring cells containing less than 1DNA equivalent known as Sub-G ${ }_{1}$. The NC3000 system was used for this experiment. The NC3000 assay is based on removal of small DNA fragments and retention of ${ }_{35}$ 4',6-diamidino-2-phenylindole (DAPI) stained higher weight fragments. After treatment with the tested compounds at the dose and conditions described above, cells were fixed with ethanol $70 \%$, stained with $1 \mu \mathrm{~g} / \mathrm{ml}$ DAPI, and analysed by differential image analysis using the NC3000 instrument measuring DAPI 40 intensity. A one way ANOVA was performed. If significant results were found in the ANOVA, a Post Hoc Test Tukey was also performed.

## Caspase activation

Activation of effector caspases is a key event in the progression 45 of apoptotic cell death. ${ }^{57}$ This activation was measured using the Fluorescent Labeled Inhibitors of Caspases (FLICA) probes that bind covalently with active caspase effector enzymes. After treatment as described above, cells were harvested and stained using the green FAM FLICA kit (Immunochemistry
${ }_{50}$ Technologies, Bloomington Min.). Samples were then analysed using the Nucleocounter NC3000 instrument. A one way ANOVA was performed. If significant results were found in the one way ANOVA, a Post Hoc Test Tukey was also performed.

## Acknowledgments

55 DSR acknowledges University Grant Commision [41-202/2012 (SR)], New Delhi, India and DU-DST PURSE, University of Delhi, Delhi, India for financial support. S. K. K. and S. M. are thankful to CSIR for the award of junior and senior research fellowship. S.V.M. would like to acknowledge the support from
${ }_{60}$ National Cancer Institute, National Institutes of Health, under Contract No. HHSN261200800001E. Authors are also thankful to CIF-USIC, University of Delhi, Delhi for NMR spectral data and RSIC, CDRI, Lucknow for mass data. We thank Alfredo Blakeley, Julie Early, Stephanie Florio, and Juliane Ollinger for ${ }_{65}$ echnical assistance.
