A simple protocol for the synthesis of a ganglioside Hp-s1 (**1**) starting from commercial available phytosphingosine, sialic acid, and D-glucose is described. This synthesis involved glycosylation reaction
10 of phytosphingosine derived acceptor with highly active benzyl protected glucosyl donor, second glycosylation of glucosyl acceptor with sialyl donor followed by Staudinger reaction, amidation, and global deprotection as key steps.

Introduction

Ganglioside is a well-known glycosphingolipid where one or
15 more sialic acids linked on the sugar chain. Being part of tissues, body fluids and nervous system, ganglioside plays important role in biological system¹ and also behaves as scavengers in body to repair and regenerate the neurons to suppress neuronal diseases.² Gangliosides have been found as inhibitory agents towards
20 Alzheimer's disease, Parkinson's diseases, Guillain-Barré syndrome, Huntington's disease and studied well in stem cell biology.³ In biological system, synthesis of such molecules take place primarily in the endoplasmic reticulum and the sequential addition of carbohydrate moieties on the existing acceptor lipid
25 take place in Golgi apparatus.⁴ Recent studies revealed that on the cell surface, gangliosides are involved in the cell-cell recognition⁵, cell differentiation⁶, and signal transduction.⁷ Marine invertebrates are the major source for gangliosides extraction and these extracts had shown neuritogenic activity
30 toward the rat pheochromocytoma cell line PC-12 in the presence of nerve growth factor.

Recently, it is observed that ganglioside Hp-s1 (**1**) shows superior neuritogenic activity (34%) then that of mammalian ganglioside GM1 (25.4%).⁸ At the same time, GM1 have more
35 complex structure and there are synthetic difficulties for the preparation of this molecule.⁹ Due to multidimensional importance of ganglioside, recently the synthesis of these molecules have attracted much attention, though few gangliosides i.e. M5, HLG-2, and LLG-3 have been synthesized by various
40 groups.¹⁰ Recently, Ye and co-workers have also reported stereoselective synthesis of trisaccharide moiety of ganglioside HLG-2.¹¹

Ganglioside Hp-s1 (**1**) (Fig. 1), isolated from the ovary of the
50 sea urchin *Diadema setosum* or the sperm of the sea urchin *Hemicentrotus pulcherrimus*.¹² The structure of ganglioside Hp-s1 possesses Neu5Ac $\alpha 2 \rightarrow 6$ Glc $\beta 1 \rightarrow 1$ Cer. The synthesis and bioassay of ganglioside Hp-s1 (**1**) has received much less attention from the scientific community. Recently, Tsai *et al*
55 synthesized analogue of ganglioside Hp-s1, which has one carbon less than Hp-s1 in the carbon chain of phytosphingosine segment and found that this analogue of ganglioside Hp-s1 exhibits neuritogenic activity toward the human neuroblastoma cell line SH-SY5Y in absence of nerve growth factor (NGF).¹³ Due to less
60 availability of ganglioside from natural sources, in continuation of our long ongoing research program on carbohydrate chemistry,¹⁴ we have selected ganglioside Hp-s1 as our target molecule and report the first total synthesis of ganglioside Hp-s1 (**1**) from commercially available sialic acid, D-glucose,
65 phytosphingosine, and D-lyxose.

Fig. 1 The structure of ganglioside Hp-s1 (1).

Results and Discussion

75 The structure of ganglioside composite with two major segments i.e. glycan part and ceramide part. The literature survey reveals that there are several approaches are accessible to connect these two segments. Mostly, two major approach have been used for this purpose i.e. i) pre-incorporation of phytosphingosine at
80 the reducing end of the glycan chain followed by assembly of the ceramide structure (non-reducing end to reducing end),¹³ ii)

glycosylation of ceramide part with the full-length glycan part which yields a ganglioside framework (reducing end to non-reducing end) directly.¹⁵ It has been observed that, reducing end to non-reducing end approach could offer high efficiency for small ganglioside syntheses. Accordingly, our retrosynthetic strategy for the synthesis of **1** can follow the sequences as shown in Scheme 1. The target compound **1** can be obtained from compound **2** through Staudinger reaction, followed by amide bond formation with **3** and global deprotection. Compound **2** can be prepared via the glycosylation of sialyl donor **5** and glycosyl acceptor **4**. The glycosylation between glucosyl donor **7** and phytosphingosine derived acceptor **6** can provide glycosyl acceptor **4**.

Scheme 1 Retrosynthesis of ganglioside Hp-s1 (**1**).

As our retrosynthetic strategy shows, initially our aim was to synthesize the phytosphingosine derived acceptor **6** and glucosyl donor **7**. In this regard, first we have turned our attention towards the synthesis of acceptor **6** (Scheme 2). We envisaged that the acceptor **6** can be prepared from commercially available phytosphingosine **8** and D-lyxose **12**. Since, both starting materials contain all the requisite chiral centers which are necessitated for the acceptor **6**, therefore, we have selected these commercially available chemicals for the synthesis of **6**. Accordingly, phytosphingosine **8**^{14a-b,16} was treated with triflyl azide (TfN₃) in the presence K₂CO₃ and catalytic amount of copper sulfate pentahydrate which produced 2-azido

Scheme 2 Synthesis of acceptor **6** from phytosphingosine **8** and D-lyxose **12**.

phytosphingosine **9** in 85% yield.¹⁷ The protection of primary alcohol functionality of **9** was carried out using *t*-butylchlorodiphenylsilane (TBDPSCI), triethylamine, and 4-di methylaminopyridine (DMAP) to furnish diol **10** in 93% yield.¹⁸ The secondary alcohol group of diol **10** was protected by using 2,2-dimethoxypropane (2,2-DMP) and catalytic amount of *p*-toluenesulfonic acid (PTSA) followed by TBAF cleavage of silane group which provided the phytosphingosine derived acceptor **6** in excellent yield for two steps (Path A, Scheme 2).¹⁷

Since, phytosphingosine **8** is an expensive compound, we have also found an alternative approach for the synthesis of **6** where we start this synthesis from cheaper compound D-lyxose **12**. In this alternative strategy (Path B, Scheme 2) the acetone protection of C₂-C₃ diol of D-lyxose **12**, followed by TBDPS protection of primary alcohol produced hemiacetal **13** in 75% yield in one-pot operation. Hemiacetal **13** was then treated with Wittig salt (C₁₃H₂₇PPh₃Br) in the presence of more hindered base LiHMDS at 0 °C, provided olefin **14** in good yield.^{14c,19} Compound **15** was obtained by hydrogenation of olefin **14** using Pd/C and hydrogen gas. C-2 epimerization of mono-ol **15** was

achieved under Mitsunobu conditions and the TBAF removal of silane group provided phytosphingosine derived acceptor **6** in good yield in one-pot synthesis.^{16b} It is worth mentioning here that the Wittig salt (C₁₃H₂₇PPh₃Br) used in this alternative path is little expensive.

Table 1 Optimization condition for glycosylation of acceptor **6** with various donors **7a-7d**.

entry	donor	promoter	solvent	T (°C)	product (yield, β/α)
1	7a ^a	NIS/TfOH	DCM	-20	16a (38%, β only)
2	7b ^a	TMSOTf	DCM	-20	16a (36%, β only)
3	7c ^a	NIS/TfOH	DCM	-20	16b (46%, β only)
4	7d ^b	TMSOTf	DCM/ACN (1/2)	-30	17 (48%, 2.0/1)
5	7d ^b	TMSOTf	DCM/ACN (1/2)	-30 °C to rt	17 (54%, 2.0/1)

7	7d ^c	TMSOTf	DCM/ACN (1/2)	0 °C to rt	17 (66%, 1.5/1)
8	7d ^c	TMSOTf	DCM/ACN (1/2)	-30 °C to rt	17 (82%, 3.2/1)

^a1.3 equiv, ^b2.0 equiv, ^c2.5 equiv.

The glucosyl acceptors **7a-7d** were synthesized following the literature procedures.²⁰ Once we have the segment **6** and **7** in our hand, now our target was to couple them. For this, in order to achieve high yield and selectivity, we have optimized the best condition of glycosylation²¹ of acceptor **6** with various donors **7a-7d**. At first, the application of anchimeric assistance in these reactions of glucosyl donors **7a-7c** with acceptor **6** has been optimized. In the beginning, thioglucoside donor **7a**^{20a} was reacted with acceptor **6** in the presence of NIS/TfOH at DCM at -20 °C furnished the β-stereoisomer **16a** in 38% yield (entry 1, table 1). To enhance to chemical yield of **16a**, imidate donor **7b**^{20b, 22} was treated with acceptor **6** in the presence of TMSOTf which provided only β stereoisomer in 36% yield (entry 2, table 1). Next, similar reaction of thioglucoside **7c**^{20c} having benzyl group at C3 position was carried out with acceptor **6**, produced compound **16b** in 46% yield (entry 3, table 1). In the above entries the low chemical yield of **16a** may be due to the less reactivity of donor's **7a-7c**. Anchimeric assistance could not provide higher yield of the compounds **16a** and **16b**. Since, the glycosylation of disarmed **7a-c** than **7d** therefore less reactive

donors reacted with acceptor **6** provided **16a** and **16b** in lower yield.

To increase the yield and selectivity, we turned our attention to study the solvent effect using **7d**^{20d} as our glucosyl donor. In this regard, imidate **7d** was allowed to react with acceptor **6** in the presence of TMSOTf provided corresponding glycosylated products (α-isomer and β-isomer) which contains acetyl group at C-6 position of glucosyl donor.²³ However, the glycosylated products (α-isomer and β-isomer) and acceptor **6** have the similar polarity on TLC, which caused difficulty in separation via column chromatography. Fortunately, we could separate the product **17** (β-isomer), α-isomer and acceptor **6** after deacetylation through column chromatography. Interestingly, we obtained a compound **17** as a mixture of stereoisomers (β:α = 2:1) at -30 °C in 48% yield (entry 4, table 1). Next, we tried to improve the yield and selectivity over β:α mixture. Variation in the temperature from -30 °C to room temperature in the similar reaction improved the yield of compound **17** to 54% with no change in stereoselectivity (entry 5, table 1). Other entries (entry 6 and 7, table 1) with changes in the temperature does not provided expected yield of compound **17** with β:α ratio. Finally, glycosylation reaction of imidate donor **7d** (2.5 equiv.) and acceptor **6** (1 equiv.) were carried out in the presence of TMSOTf and 3 Å molecular sieves in DCM/ACN solvent at -30 °C to room temperature (entry 8, table 1), gave corresponding compound **17** in 82% overall yield for two steps.

Table 2 Optimization condition for glycosylation of acceptor **17** with various donors **5a-5d**.

entry	donor	promoter	Product (yield, αβ/ββ)
1	5a	NIS/TfOH	18a (86%, 2.7/1)
2	5b	NIS/TfOH	18a (84%, 3.9/1)
3	5c	AgOTf	18a (29%, 2.6/1)
4	5d	NIS/TfOH	18b (54%, 1.6/1)
5	5d	NIS/TMSOTf	18b (77%, 2.0/1)

Next we have synthesized various sialyl donors (**5a-5d**) according to the procedures available in the literature.²⁴⁻²⁷ Then, we performed the glycosylation between various sialyl donors (**5a-5d**) and glucosyl acceptor **17** using different promoters as shown in Table 2. Accordingly, first, sialyl donor **5a**²⁴ was treated with acceptor **17** in the presence of *N*-iodosuccinimide

(NIS) and trifluoromethanesulfonic acid (TfOH) using DCM and ACN solvent system at $-30\text{ }^{\circ}\text{C}$, provided the compound **18a** in 86% yield ($\alpha\beta/\beta\beta = 2.7/1$, entry 1, table 2). Similarly, sialyl donor **5b**²⁵ on treatment with acceptor **17** in the presence of NIS and TfOH under same reaction conditions furnished compound **18a** in 84% yield ($\alpha\beta/\beta\beta = 3.9/1$, entry 2, table 2). When AgOTf was used for glycosylation reaction between sialyl donor **5c**²⁶ with acceptor **17** in similar condition (entry 3, table 2), we obtained compound **18a** in comparatively less yield (29%) with bad selectivity. Previously, sialyl donor **5d** was found to be a suitable donor for glycosylation reaction resulting high selectivity with good yields.²⁷ However, when we treated sialyl donor **5d**²⁷ with acceptor **17** under the influence of NIS and TfOH, provided the corresponding compound **18b** in 54% yield ($\alpha\beta/\beta\beta = 1.6/1$, entry 4, table 2). Change of promoter from NIS/TfOH to NIS/TMSOTf for glycosylation reaction between sialyl donor **5d** with acceptor **17**, afforded **18b** in 77% yield ($\alpha\beta/\beta\beta = 2.0/1$, entry 5, table 2).

Scheme 3 Finalizing synthesis of target molecule 1.

Now, we have subjected the compound **18a** for sequential Staudinger reaction and amide bond formation as shown in Scheme 3, which provided **19** in 51% overall yield for two steps. The deprotection of acetyl, benzyl, and acetone groups of compound **19** provided the target molecule ganglioside Hp-s1 (**1**) in 85% yield.

Conclusions

We have developed first synthesis of ganglioside Hp-s1 (**1**) overall yield of 21.5% and 9.6% starting from phytosphingosine or D-lyxose respectively in ten steps. In the assembly of the glycan part, Neu5Ac α 2 \rightarrow 6Glc β 1 \rightarrow 1Cer, the three chiral carbons of the ceramide part were each efficiently established in a

stereoselective manner from commercially available phytosphingosine and D-lyxose. The final connection of the glycan and ceramide parts was accomplished with relatively high yield. This short and efficient route described here for the synthesis of ganglioside Hp-s1 is expected to provide access to other structurally related glycolipids for exploring their neurotogenic activities and other biological properties.

Experimental Section

General Information

Some reactions were conducted in flame-dried glassware, under nitrogen atmosphere. Dichloromethane, tetrahydrofuran, *N,N*-dimethylformamide were purified and dried from a safe purification system containing activated Al_2O_3 . All reagents obtained from commercial sources were used without purification, unless otherwise mentioned. Phytosphingosine was purchased from Tokyo Chemical Industry Co. Ltd, Japan and D-lyxose was purchased from Carbosynth China Ltd, China. Flash column chromatography was carried out on Silica Gel 60 (230-400 mesh, E. Merck). TLC was performed on pre-coated glass plates of Silica Gel 60 F254 (0.25mm, E. Merck); detection was executed by spraying with a solution of $\text{Ce}(\text{NH}_4)_2(\text{NO}_3)_6$ (0.5 g), $(\text{NH}_4)_6\text{Mo}_7\text{O}_{24}$ (24 g) and H_2SO_4 (28 mL) in water (500 mL) and subsequent heating on a hot plate. Optical rotations were measured at 589 nm (Na) at $\sim 27\text{ }^{\circ}\text{C}$, ^1H , ^{13}C NMR, DEPT, ^1H - ^1H COSY, ^1H - ^{13}C COSY, and NOESY spectra were recorded with 400 and 600 MHz instruments. Chemical shifts are in ppm from Me_4Si generated from the CDCl_3 lock signal at δ 7.26. IR spectra were taken with a FT-IR spectrometer using KBr plates. Mass spectra were analyzed on Orbitrap instrument with an ESI source.

(2S,3S,4R)-2-Azido-octadecan-1,3,4-triol (9). A mixture solution of NaN_3 (2.04 g, 31.50 mmol), DCM (5 mL) and water (5 mL) was cooled at $0\text{ }^{\circ}\text{C}$ and Tf_2O (1.10 mL, 6.30 mmol) was added dropwise over 20 min. After the reaction mixture was stirred for 3 h, the mixture was extracted with DCM ($2 \times 8\text{ mL}$). The combined organic layer was washed with saturated NaHCO_3 (16 mL) formed a combined organic layer which contains TfN_3 . To a suspension of phytosphingosine (1.00 g, 3.15 mmol), K_2CO_3 (2.14 g, 15.75 mmol) and $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ (16 mg, 0.01 mmol) in a mixture of methanol (4 mL) and water (3 mL) were added the combined organic layer which contained TfN_3 . The reaction mixture was stirred for 12 h. After reaction was completed, the resulting solution was concentrated to remove the organic solvent under vacuum. The mixture was extracted with EtOAc ($2 \times 24\text{ mL}$) and the combined organic layers were dried over anhydrous MgSO_4 , filtered, and concentrated under reduced pressure. The residue was recrystallized with EtOH to give the triol **9** (917 mg) in 85% yield as white solid. R_f 0.50 (EtOAc/Hex = 1/1); $[\alpha]_D^{26} +4.5$ (c 0.85, MeOH); mp $97\text{ }^{\circ}\text{C}$; IR (KBr) ν 3343, 2918, 2848, 2118, 1463 cm^{-1} ; ^1H NMR (600 MHz, CD_3OD) δ 3.92 (dd, $J = 10.8, 3.0\text{ Hz}$, 1H, H-1a), 3.75 (dd, $J = 10.8, 7.8\text{ Hz}$, 1H, H-1b), 3.59 (ddd, $J = 7.8, 4.2, 3.0\text{ Hz}$, 1H, H-2), 3.54-3.50 (m, 2H, H-3, H-4), 1.70-1.66 (m, 1H, H-5a), 1.57-1.54 (m, 1H, H-5b), 1.41-1.25 (m, 24H, CH_2), 0.89 (t, $J = 7.2\text{ Hz}$, 3H, CH_3); ^{13}C NMR (150

MHz, CD₃OD) δ 76.0 (CH), 72.8 (CH), 66.7 (CH), 62.5 (CH₂), 33.9 (CH₂), 33.1 (CH₂), 30.8 (CH₂ \times 8), 30.5 (CH₂), 26.7 (CH₂), 23.7 (CH₂), 14.5 (CH₃); HRMS (ESI, M+Na⁺) calcd for C₁₈H₃₇O₃N₃Na 366.2727, found 366.2723.

(2S,3S,4R)-2-Azido-1-O-tert-butylidiphenylsilyl-octadecan-1,3,4-triol (10). To a solution of 2-azido phytosphingosine **9** (100 mg, 0.29 mmol) in DCM (1.4 mL) and DMF (0.3 mL) were added Et₃N (0.10 mL, 0.73 mmol), DMAP (1 mg, 0.01 mmol) and TBDPSCI (93 μ L, 0.35 mmol) at 0 °C. The reaction mixture was stirred at room temperature for 24 h, and then diluted with EtOAc (10 mL). The organic layers were washed with brine (5 mL), dried over MgSO₄, filtered, and concentrated under reduced pressure. The residue was purified by column chromatography on silica gel to give the compound **10** (155.7 mg) in 93% yield as colorless oil. *R_f* 0.53 (EtOAc/Hex = 1/4); [α]_D²⁶ +16.4 (c 1.0, CH₂Cl₂); IR (CH₂Cl₂) ν 3425, 2926, 2855, 2099, 1466, 1428, 1113 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 7.72-7.69 (m, 4H, ArH), 7.47-7.38 (m, 6H, ArH), 4.03 (dd, *J* = 10.8, 4.2 Hz, 1H, H-1a), 3.92 (dd, *J* = 10.8, 6.0 Hz, 1H, H-1b), 3.70-3.66 (m, 2H, H-3, H-4), 3.57 (ddd, *J* = 6.0, 4.2, 4.2 Hz, 1H, H-2), 1.57 (bs, 2H, OH), 1.56-1.40 (m, 2H, H-5a, H-5b), 1.26 (bs, 23H, CH₂), 1.08 (s, 9H, CH₃), 0.88 (t, *J* = 6.6 Hz, 3H, CH₃); ¹³C NMR (150 MHz, CDCl₃) δ 135.6 (CH \times 4), 132.5 (C), 132.4 (C), 130.0 (CH \times 2), 127.9 (CH \times 3), 74.1 (CH), 72.3 (CH), 64.1 (CH₂), 63.4 (CH), 31.9 (CH₂), 31.8 (CH₂), 29.7 (CH₂ \times 3), 29.6 (CH₂ \times 3), 29.3 (CH₂ \times 3), 26.7 (CH₃ \times 3), 25.6 (CH₂), 22.7 (CH₂), 19.1 (C), 14.1 (CH₃); HRMS (ESI, M+Na⁺) calcd for C₃₄H₅₅O₃N₃NaSi 604.3905, found 604.3912.

(2S,3S,4R)-2-Azido-1-O-tert-butylidiphenylsilyl-3,4-O-isopropylidene-octadecan-1,3,4-triol (11). To a solution of the diol **10** (155 mg, 0.27 mmol) in acetone (8 mL) were added 2,2-dimethoxypropane (338 μ L, 2.70 mmol) and PTSA (6 mg, 0.03 mmol). The reaction mixture was stirred for 3 h at room temperature and neutralized with Et₃N at 0 °C. The reaction mixture was concentrated under reduced pressure. The residue was purified by column chromatography on silica gel to give the product (166 mg) in 99% yield as colorless oil. *R_f* 0.61 (EtOAc/Hex = 1/20); [α]_D²⁶ +11.9 (c 1.0, CH₂Cl₂); IR (CH₂Cl₂) ν 2957, 2927, 2855, 2099, 1465, 1428, 1113 cm⁻¹; ¹H NMR (600 MHz, CDCl₃) δ 7.74-7.70 (m, 4H, ArH), 7.45-7.38 (m, 6H, ArH), 4.12 (ddd, *J* = 9.6, 4.8, 2.4 Hz, 1H, H-4), 4.03 (dd, *J* = 10.8, 2.4 Hz, 1H, H-1a), 3.94 (dd, *J* = 10.2, 6.0 Hz, 1H, H-3), 3.84 (dd, *J* = 10.8, 6.6 Hz, 1H, H-1b), 3.42 (ddd, *J* = 9.6, 6.6, 2.4 Hz, 1H, H-2), 1.62-1.47 (m, 2H, CH₂), 1.38-1.26 (m, 30H, CH₂, CH₃), 1.08 (s, 9H, CH₃), 0.88 (t, *J* = 7.2 Hz, 3H, CH₃); ¹³C NMR (150 MHz, CDCl₃) δ 135.7 (CH \times 4), 133.0 (C), 132.9 (C), 129.8 (CH), 129.7 (CH), 127.7 (CH \times 4), 108.1 (C), 77.8 (CH), 75.2 (CH), 65.3 (CH₂), 61.7 (CH), 31.9 (CH₂), 29.7 (CH₂ \times 6), 29.6 (CH₂ \times 2), 29.4 (CH₂ \times 2), 28.1 (CH₃), 26.7 (CH₃ \times 3), 26.4 (CH₂), 25.7 (CH₃), 22.7 (CH₂), 19.1 (C), 14.1 (CH₃); HRMS (ESI, M+Na⁺) calcd for C₃₇H₅₉O₃N₃NaSi 644.4218, found 644.4213.

5-O-tert-Butylidiphenylsilyl-2,3-O-isopropylidene-D-lyxofuranose (13). To a solution of D-lyxose **12** (200 mg, 1.33 mmol) in acetone (2 mL) were added H₂SO₄ (7.0 μ L, 0.13 mmol) at 0 °C. The reaction mixture was warmed to room temperature and kept

stirring until a clear solution was achieved. Then imidazole (362 mg) dissolved in dichloromethane (2 mL) and *tert*-butylchlorodiphenylsilane (388 μ L) was added to the clear solution at 0 °C. The reaction mixture was warmed to room temperature and stirred for 3 h. After completion, the reaction mixture was concentrated under reduced pressure to afford a residue. The residue was diluted with water (10 mL) and extracted with dichloromethane (3 \times 10 mL). The organic layer was dried over anhydrous MgSO₄, filtered, and concentrated to afford a residue. The residue was purified by column chromatography on silica gel to give the product **13** (426 mg, 75%) as colorless oil. *R_f* 0.58 (EtOAc/Hex = 1/3); [α]_D²⁶ +2.83 (c 1.0, CH₂Cl₂); IR (CH₂Cl₂) ν 3473, 3072, 3050, 2937, 2890, 2859, 1468, 1428, 1377, 1210, 1108 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 7.73-7.67 (m, 4H, ArH), 7.44-7.35 (m, 6H, ArH), 5.37 (d, *J* = 1.6 Hz, 1H, H-1), 4.75 (dd, *J* = 5.6, 3.2 Hz, 1H, H-3), 4.59 (d, *J* = 6.4 Hz, 1H, H-2), 4.32 (ddd, *J* = 10.0, 6.4, 4.0 Hz, 1H, H-4), 3.99 (dd, *J* = 10.8, 5.6 Hz, 1H, H-5a), 3.90 (dd, *J* = 10.4, 6.4 Hz, 1H, H-5b), 2.31 (bs, 1H, OH), 1.35 (s, 3H, CH₃), 1.29 (s, 3H, CH₃), 1.06 (s, 9H, CH₃); ¹³C NMR (100 MHz, CDCl₃) δ 135.64 (CH \times 2), 135.58 (CH \times 2), 133.4 (C \times 2), 129.58 (CH), 129.57 (CH), 127.6 (CH \times 2), 127.5 (CH \times 2), 112.3 (C), 101.2 (CH), 85.4 (CH), 80.8 (CH), 79.7 (CH), 62.0 (CH₂), 26.7 (CH₃ \times 3), 25.9 (CH₃), 25.0 (CH₃), 19.2 (C); HRMS (ESI, M+Na⁺) calcd for C₂₄H₃₂O₅NaSi 451.1911, found 451.1907.

(2R,3S,4R)-1-tert-Butylidiphenylsilyl-3,4-O-isopropylideneoctadec-5-ene-1,2,3,4-tetraol (14). To a solution of hemiacetal **13** (275 mg, 0.64 mmol) and tridecanyltriphenylphosphonium bromide (1.35 g, 2.57 mmol) in anhydrous THF (2.8 mL) was cooled down to 0 °C under nitrogen. A 1 M solution of lithium hexamethyldisilylamide in THF (2.6 mL, 2.57 mmol) was slowly added to the mixture and the reaction solution was kept stirring for overnight at 0 °C. After completion of the reaction, water (10 mL) was added to quench the reaction and the mixture was extracted with EtOAc (3 \times 10 mL). The combined organic layers were dried over anhydrous MgSO₄, filtered, and concentrated in vacuo to afford a residue. The residue was purified by column chromatography to afford the olefin **14** (336 mg, 88%, *Z/E* = 2.75/1). *R_f* 0.49 (EtOAc/Hex = 1/9); [α]_D²⁷ -5.7 (c 1.0, CH₂Cl₂); IR (CH₂Cl₂) ν 3523, 2927, 2855, 1465, 1428, 1374, 1112 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 7.68-7.64 (m, 4H, ArH), 7.45-7.34 (m, 6H, ArH), 5.70-5.57 (m, 2H, CH=CH), 4.50 (dd, *J* = 8.0, 6.8 Hz, 1H, H-4), 4.26 (dd, *J* = 6.8, 3.6 Hz, 1H, H-3), 3.71-3.61 (m, 3H, H-1a, H-1b, H-2), 2.44 (d, *J* = 6.0 Hz, 1H, 2-OH), 2.05-1.95 (m, 2H, CH₂), 1.50 (s, 3H, CH₃), 1.38 (s, 3H, CH₃), 1.34-1.22 (m, 20H, CH₂), 1.06 (s, 9H, CH₃), 0.88 (t, *J* = 6.8 Hz, 3H, CH₃); ¹³C NMR (100 MHz, CDCl₃) δ 137.5 (CH), 135.6 (CH \times 2), 135.5 (CH \times 2), 133.2 (C), 133.1 (C), 129.8 (CH), 129.7 (CH), 127.72 (CH \times 2), 127.68 (CH \times 2), 125.4 (CH), 108.2 (C), 78.9 (CH), 77.0 (CH), 70.0 (CH), 64.7 (CH₂), 32.2 (CH₂), 31.9 (CH₂), 29.7 (CH₂ \times 2), 29.62 (CH₂), 29.58 (CH₂), 29.4 (CH₂), 29.3 (CH₂), 29.2 (CH₂), 28.9 (CH₂), 27.2 (CH₃), 26.8 (CH₃ \times 3), 24.9 (CH₃), 22.7 (CH₂), 19.2 (C), 14.1 (CH₃); HRMS (ESI, M+Na⁺) calcd for C₃₇H₅₈O₄NaSi 617.3997, found 617.4010.

(2R,3S,4R)-1-O-tert-Butylidiphenylsilyl-3,4-O-isopropylidene-

octadecan-1,2,3,4-tetraol (15). A mixture of olefin **14** (310 mg, 0.52 mmol), 10% palladium on charcoal (62 mg) and ethyl acetate (3.1 mL) was stirred under hydrogen gas at room temperature for 8 h. The Pd/C was removed through celite. The filtrate was concentrated to give the residue. The residue was purified by column chromatography on silica gel to afford compound **15** (248 mg, 80%) as colorless oil. (Methyl 5-acetamido-7,8,9-tri-O-acetyl-3,5-dideoxy-D-glycero- α -D-galacto-2-nonulopyranosylonate)-(2 \rightarrow 6)-2,3,4-tri-O-benzyl- β -D-glucopyranosyl-(1 \rightarrow 1)-(2S,3S,4R)-2-azido-3,4-O-isopropylidene-octadecan-1,3,4-triol (18a). *Method A:* A solution of donor **5a** (56 mg, 0.09 mmol) and primary alcohol **17** (63 mg, 0.08 mmol) in DCM/ACN (1/2 ratio, 10 mL) was stirred for 1 h at room temperature with activated 3 Å molecular sieves (180 mg). After cooling to -30 °C, NIS (52 mg, 0.23 mmol) and TfOH (3 μL , 0.04 mmol) were added and reaction mixture was stirred for 2 h. When the reaction was completed, molecular sieves was removed by filtration through celite. The filtrate was extracted with aqueous $\text{Na}_2\text{S}_2\text{O}_3$ (10 mL) and brine (10 mL), and the organic layers were dried over anhydrous MgSO_4 , filtered, and concentrated to *vacuo*. The residue was purified by column chromatography on silica gel to give the desired product **18a** (86 mg, 86%, $\alpha\beta/\beta\beta=2.7/1$) as white solid. *Method B:* A solution of donor **5b** (43 mg, 0.07 mmol) and primary alcohol **17** (53 mg, 0.06 mmol) in a mixture of DCM and ACN (1/2 ratio, 0.90 mL) was stirred for 1 h at room temperature with activated 3 Å molecular sieves (140 mg). After cooling to -30 °C, NIS (40 mg, 0.18 mmol) and TfOH (4 μL , 0.04 mmol) were added and reaction mixture was stirred for 2 h. When the reaction was completed, molecular sieves was removed by filtration through celite. The filtrate was extracted with aqueous $\text{Na}_2\text{S}_2\text{O}_3$ (10 mL) and brine (10 mL), and the organic layers were dried over anhydrous MgSO_4 , filtered, and concentrated to *vacuo*. The residue was purified by column chromatography on silica gel to give the desired product **18a** (69 mg, 84%, $\alpha\beta/\beta\beta=3.2/1$) as white solid. *Method C:* A solution of donor **5c** (63 mg, 0.10 mmol) and primary alcohol **17** (68 mg, 0.08 mmol) in DCM/ACN (1/2 ratio, 11 mL) was stirred for 1 h at room temperature with activated 3 Å molecular sieves (200 mg). After cooling to -30 °C, AgOTf (86 mg, 0.33 mmol) were added and reaction mixture was stirred for 21 h. When the reaction was completed, molecular sieves was removed by filtration through celite. The filtrate was extracted with aqueous NaHCO_3 (10 mL) and brine (10 mL), and the organic layers were dried over anhydrous MgSO_4 , filtered, and concentrated to *vacuo*. The residue was purified by column chromatography on silica gel to give the desired product **18a** (31 mg, 29%, $\alpha\beta/\beta\beta=2.6/1$) as white solid. 110 (5-acetamido-3,5-dideoxy-*D*-glycero- α -*D*-galacto-2-nonulopyranosyloic-acid)-(2 \rightarrow 6)- β -*D*-glucopyranosyl-(1 \rightarrow 1)-(2*S*,3*S*,4*R*)-2-octadecanoylaminoheptadecan-1,3,4-triol (1). To a solution of trisaccharide derivative 19 (74 mg, 0.05 mmol) in methanol (2 mL) was added NaOH (1 mL, 1 N). The reaction mixture was stirred at 50 °C. After 1 h, the reaction mixture was concentrated

under reduced pressure without further purification to get the residue. The residue (45 mg) was dissolved in a mixed solvent of MeOH/CHCl₃ (3/1 ratio, 0.60 mL) at room temperature. The Pd(OH)₂/C (45 mg, Degussa type) was added to the solution and followed by addition 3 drops of acetic acid, the reaction vessel was purged with hydrogen gas, and the mixture was stirred under 60 psi pressure at room temperature for 5 h. The resulting solution was filtered through celite and the filtrate was concentrated in vacuo. Since, several attempts to purify the target compound **1** using column chromatography with various solvent systems were unsuccessful. However, we have developed simple technique to purify the target compound **1**. Vertical glass column was packed using 29.26 g of silica gel 60 (230-400 mesh, E. Merck) in the CHCl₃ mobile phase. The crude compound of **1** (45 mg) in 3 mL mixture solution of MeOH and CHCl₃ = 1/3 is placed inside the top of the vertical glass column. The 200 mL eluent (MeOH/CHCl₃, 50 mL/150 mL) were used as eluting solvent flowing down through the column. Subsequently, eluent phase was changed to (MeOH/CHCl₃/H₂O, 50 mL/150 mL/5 mL) so that the impurity could remove easily. Final eluent solvent (MeOH/CHCl₃/H₂O, 50 mL/150 mL/10 mL) was loaded in the vertical column solvent reservoir and solvent phase in the column becomes heterogeneous mixture (lower MeOH/CHCl₃ layer and higher H₂O layer). The higher H₂O layer were removed by pipette and remaining homogenous layer was used as eluting solvent flowing down through the column to get highly pure target compound **1** (15 mg, 85%). *R_f* 0.54 (MeOH/CHCl₃/H₂O = 1/2.4/0.2); [α]_D²⁵ -2.4 (c 0.25, MeOH); IR (KBr) ν 3316, 2926, 2850, 1632, 1552, 1466, 1383, 1135, 1036 cm⁻¹; ¹H NMR (600 MHz, CD₃OD) δ 4.24 (d, *J* = 7.8 Hz, 1H, H-1'), 4.13-4.07 (m, 2H, H-8'', H-9a''), 4.01 (dd, *J* = 10.8, 4.8 Hz, 1H, H-6a'), 3.86 (ddd, *J* = 9.0, 6.0, 3.0 Hz, 1H, H-5''), 3.81 (dd, *J* = 11.4, 2.4 Hz, 1H, H-1a), 3.74 (dd, *J* = 10.8, 2.4 Hz, 1H, H-6b'), 3.71-3.64 (m, 4H, H-3, H-4'', H-7'', H-9b''), 3.61 (dd, *J* = 11.4, 5.4 Hz, 1H, H-1b), 3.56-3.49 (m, 3H, H-2, H-4, H-6''), 3.42 (t, *J* = 9.0 Hz, 1H, H-4'), 3.36-3.32 (m, 2H, H-3', H-5'), 3.20 (t, *J* = 8.4 Hz, 1H), 2.84 (dd, *J* = 12.0, 3.6 Hz, 1H, H-3a''), 2.22-2.20 (m, 2H, CH₂), 2.01 (s, 3H, CH₃), 1.63-1.52 (m, 5H, H-3b''), 1.45-1.42 (m, 2H, CH₂), 1.30 (bs, 50H, CH₂), 0.89 (t, *J* = 6.6 Hz, 6H); ¹³C NMR (150 MHz, CDCl₃) δ 176.0 (C), 175.6 (C), 174.2 (C), 104.7 (CH), 101.5 (C), 77.6 (CH), 76.4 (CH), 75.1 (CH), 74.7 (CH), 74.3 (CH), 72.9 (CH), 72.8 (CH), 71.3 (CH), 70.2 (CH \times 1, CH₂ \times 1), 69.4 (CH), 64.4 (CH₂), 64.1 (CH₂), 54.2 (CH), 52.0 (CH), 42.5 (CH₂), 37.3 (CH₂), 33.1 (CH₂ \times 2), 31.9 (CH₂), 31.0 (CH₂ \times 2), 30.9 (CH₂ \times 7), 30.8 (CH₂ \times 5), 30.7 (CH₂ \times 2), 30.53 (CH₂ \times 2), 30.50 (CH₂ \times 2), 30.45 (CH₂ \times 2), 27.2 (CH₂), 23.8 (CH₂ \times 1, CH₃ \times 1), 22.6 (CH₂), 14.5 (CH₃ \times 2); HRMS (ESI, M+Na⁺) calcd for C₅₃H₁₀₀O₁₇N₂Na 1059.6914, found 1059.6900.

Graphical Abstract

Total synthesis of the ganglioside Hp-s1 (**1**) in ten steps is described.
