Abstract

In-situ protolysis reaction of highly basic and sterically hindered N.N'-di-tert-butyliminophosphonamide ligand $Ph_2P(=N-tBu)(NH-tBu) = (NPN^{tBu})H$ (1) with equimolar or of hemimolar amounts rare-earth metal tris-alkyls leads to dialkvl $[(NPN^{tBu})Ln(CH_2SiMe_3)_2(THF)_n]$ (Ln = Sc, n = 0 (2), Ln = Y, n = 1 (3)) and monoalkyl species $[(NPN^{Bu})_2Ln(CH_2SiMe_3)]$ (Ln = Y (4), Nd (6), Sm (7)). One-pot reaction of [ScCl₃(THF)₃]/1/MeLi in 1/2/3 eq. ratio gives [(NPN^{tBu})₂Sc(THF)CH₃] 5. Further reaction of 4 with phenylacetylene resulted in formation of Y-alkynyl complex $[(NPN^{tBu})_2Y(-C \equiv CPh)]$ 8. Alkyl abstraction in 2, 3 and 4 by reaction with [PhNMe₂H]⁺[B($C_{6}F_{5})_{4}$]⁻ resulted in formation of cationic alkyl complex ion-pairs $[(NPN^{tBu})Ln(CH_2SiMe_3)(THF)_n]^+[B(C_6F_5)_4]^-(Ln = Sc (9),$ Y (10)) and $[(NPN'^{Bu})_2Y(THF)_n]^+[B(C_6F_5)_4]^-$ 11, as confirmed by NMR data. The reaction of bis-NPN alkyl complexes with CHCl₃ is the most simple and reliable protocol to synthesize bis-NPN-chlorido complexs [(NPN^{tBu})₂Ln-Cl] (Ln = Sc (12), Y (13), Nd (14), Sm (15), Gd (16), Tb (17), Yb (18) and Lu (19)), which can become new post-metallocene alternatives to the prominent organolanthanide building blocks [Cp*2LnX]. Partial hydrolysis of 12 leads to formation of oxido/chlorido-capped trinuclear complex [$\{(NPN^{tBu})Sc(\mu_2-Cl)\}_3(\mu_3-Cl)\}$] 20. Molecular structures of 4, 6, 7, 13, 19 and 20 were confirmed by X-ray structure analyses.

<u>Key words:</u> *iminophosphonamide ligand, rare-earth metals, lanthanides, alkyl complexes, ion-paired borates, alkyl abstraction, alkynyl complexes, chlorido complexes*

Introduction

In the course of our systematic studies of ambident organophosphorus(V) donor ligands of the general type $[R_2P(X)Z]^-$ (X, Z = S, O, NR', CH₂, CHR', Cp, Ind, Flu; as for X=Z and X \neq Z)¹ we turned our attention to the chemistry of iminophosphonamide ligands $[R_2P(NR')_2]^-$ (NPN) and their rare-earth metal complexes. The ligands are isoelectronic analogues of phosphinate anions, in which oxygen atoms are replaced by two imido groups. The influence of nitrogen substituents R' on ligand properties is definitely stronger than that of R groups at the more remote phosphorus centre.

First reports of rare-earth metal NPN complexes by Edelmann, Schumann and coworkers appeared in the 80-90's using A-type ligands (see Chart 1) with SiMe₃ (tms) substituents at the nitrogen atoms for the preparation of Pr^{III} and Nd^{III} chlorido complexes I and Ac^{IV} chlorido and oxo complexes (II and III),² yet none of them was structurally characterised. Later, Sm^{III} and Yb^{II}- complexes (IV and V)³ as well as a series of Ln-COT NPN-complexes (VI)⁴ have been reported.

In 2006 Hill and co-workers reported several rare-earth metal tms₂N- and dms₂Ncomplexes (dms: SiMe₂H) bearing chiral {DACH}-bridged bis-NPN ligand regime (VII) (DACH = trans-diaminocyclohexane)⁵ that are highly active one-component catalysts for the stereoselective polymerisation of MMA. Numerous rare-earth metals complexes based on Btype NPN-ligands having aromatic moieties on the nitrogen atoms (VIII) have been reported by the research groups of Cui and Hou.⁶ The catalytic precursors based on rare-earth metal complexes of iminophosphonamide (NPN) skeletons show high efficiency for 3,4-selective polymerisations of 1,3-conjugated dienes. The regio- and stereoselectivities of these catalytic species are strongly dependent on the ortho substituents of the nitrogen bonded aryl ring, of which the sterically demanding ones prefer to show high 3,4-selectivity.^{6a,b} Moreover, a borohydrido neodymium (IX) and recently 4-methylbenzyl neodymium and lanthanum (X) B-type NPN-complexes has been reported to act as efficient catalysts for the trans-1,4selective polymerisation of isoprene.⁷ Further examples of alkali and alkali-earth metals.⁸ Al and Ga,^{5,9} Ti and Zr,¹⁰ Cr,¹¹ Co,¹² Ni,¹³ Pd and Pt,^{12c,14} Cu,¹⁵ Ag,¹⁶ and Zn^{12d,17} NPNcomplexes are know from the literature. Being able to donate up to 6-electrons, anionic NPN ligands can serve as steric and electronic pendants to Cp or Cp* ligands, however in rare-earth metal chemistry only ligands with electron withdrawing N-silyl (type A, examples I-VI) or N-aryl (type **B**, examples **VIII–IX**) substituents were thoroughly investigated so far (Chart 1). The higher the basicity of a ligand, the better its ability to donate electrons and to compensate part of the Lewis acidity of a rare-earth metal centre.

Chart 1. Different types of NPN ligands (A–C).

Chart 2. Known rare-earth metal NPN complexes (I-X).

Dalton Transactions Accepted Manuscript

Here we report on the so far unknown rare-earth metal chemistry of the sterically demanding, very basic, easily accessible and perfectly soluble N,N'-bis-*tert*-butyl-iminophosphonamide ligand (type C) $Ph_2P(=N-tBu)(NH-tBu) = (NPN^{tBu})H(1)$.

Synthesis of mono-(NPNtBu) dialkyl rare-earth metal complexes

Initial attempts to prepare $[(NPN^{tBu})Ln(CH_2SiMe_3)_2(THF)_n]$ complexes using *in situ* prepared rare-earth metal tris-alkyls $[Ln(CH_2SiMe_3)_3(THF)_n]$ from $[LnCl_3(THF)_n]$ and 3 eq. of LiCH_2SiMe_3 was fully successful only for the solvent-free Sc-derivative $[(NPN^{tBu})Sc(CH_2SiMe_3)_2]$ **2**. In the case of the larger cation Y^{3+} , formation of the target mono-NPN species $[(NPN^{tBu})Y(CH_2SiMe_3)_2(THF)]$ **3** was accompanied by a small amount of bis-NPN complex $[(NPN^{tBu})_2Y(CH_2SiMe_3)]$ **4** as a by-product in the NMR spectra. Although **4** is less soluble in n-pentane or n-hexane than **3**, we have not succeed to separate it and isolate pure **3** by this method.

Scheme 1. Preparation of mono-NPN complexes 2 and 3.

Selective and high yield syntheses of very pure **2** and **3** complexes have been achieved using the alkane elimination route from the *purely isolated* tris-neosilyl precursors $[Sc(CH_2SiMe_3)_3(THF)_2]$ and $[Y(CH_2SiMe_3)_3(THF)_3]$. A pre-cooled 0 °C diethyl ether solution of **1** was added drop-wise to a solution of the trialkyl in n-pentane or n-hexane at 0 °C. In ³¹P NMR spectra sharp signals are observed at 12.2 (**2**) and 18.1 (**3**) ppm. ¹H NMR spectra of NPN complexes are represented by the signals of the trimethylsilyl and *tert*-butyl groups that appear in both **2** and **3** around 0.45 and 1.11 ppm correspondingly. The methylene groups are observed as singlet at 0.25 ppm for **2** and as doublet at -0.26 ppm with ²*J*_{HY} = 3.0 Hz for **3**. In the ¹H NMR spectrum of scandium complex **2** no signals of the THF molecule are observed. In contrast, in the Y-complex **3** signals at 1.34 and 3.88 ppm with an overall intensity of 8H are clearly seen and undoubtedly assigned to a coordinating THF molecule. The assignment of signals in ¹³C NMR spectra was carried out by two-dimensional NMR spectroscopy. The

signals for phenyl groups are observed in the range of about 130-140 ppm as doublets with different J_{CP} coupling constants.

Synthesis of bis-(NPNtBu) monoalkyl rare-earth metal complexes

Following synthetic protocols described by B. Hessen et al. for bis-neosilyl benzamidinate rare-earth metal complexes,¹⁸ we successfully applied them both to the synthesis of bis-(NPN^{*t*Bu}) monoalkyl rare-earth metal complexes [(NPN^{*t* $Bu})_2Ln(CH_2SiMe_3)]$ - either starting from *in situ* or from *purely isolated* tris-neosilyl $[Ln(CH_2SiMe_3)_3(THF)_n]$ precursors. Both protocols allow to prepare [(NPN^{*t* $Bu})_2Y(CH_2SiMe_3)]$ **4** in high yields (85% – for *in situ* method and 91% – for the *purely isolated* one, see Schemes 2 and 4). Purification was achieved by crystallisation from n-hexane at –30 °C.

Scheme 2. Preparation of [(NPN^{tBu})₂Y(CH₂SiMe₃)] 4.

As expected reaction of 1 eq. of $[Sc(CH_2SiMe_3)_3(THF)]$ with 2 eq. of 1 doesn't allow to isolate bis-(NPN^{*t*Bu}) scandium derivative: because of the small ionic radius of scandium metal centre it cannot coordinate two bulky (NPN^{*t*Bu})-ligands and further one bulky Me₃SiCH₂-group.

Yet, when instead of Me₃SiCH₂-group a simple CH₃-group was used corresponding bis-NPN scandium derivative can be easily obtained. Thus, a simple *one-pot* protocol starting from 2 eq. of **1** and 1 eq. of [ScCl₃(THF)₃] suspended in diethyl ether at 0 °C followed by addition of 3 eq. of MeLi for 1 h (Scheme 3) leads to a new bis-NPN scandium complex [(NPN^{*t*Bu})₂Sc(THF)CH₃] **5** that has been isolated as a pure colourless solid in 59% yield.

Scheme 3. Preparation of $[(NPN^{tBu})_2Sc(THF)CH_3]$ 5.

Page 6 of 30

The ³¹P NMR spectrum of **5** shows a signal at 19.6 ppm, that is very close to that of **4** (see above). The CH₃-group is observed downfield shifted at 0.61 ppm in ¹H and at 22.8 ppm in ¹³C NMR spectra. Co-ordinated THF is also confirmed by both ¹H and ¹³C NMR spectra.

Isolation of tris-alkyl-derivatives of the larger rare-earth metals in a pure form is a serious synthetic task because of their low thermal stability. NPN-complexes of these metals have been synthesized using described above *in situ* method (Scheme 4). For completion of tris-alkyls' formation from $[LnCl_3(THF)_m]$ and $LiCH_2SiMe_3$ the reaction mixture was stirred for 1 h at 0 °C, followed by addition of 2 eq. of **1** in diethyl ether. By this method two new bis-NPN-alkyl complexes $[(NPN^{tBu})_2Nd(CH_2SiMe_3)]$ **6** and $[(NPN^{tBu})_2Sm(CH_2SiMe_3)]$ **7** have been synthesized. Thus isolated **6** and **7** are slightly (up to 10%) contaminated by another NPN-metallated species presumably by lithiated **1** as confirmed by their NMR spectra.

Scheme 4. Preparation of bis-NPN complexes [(NPN^{tBu})₂Ln(CH₂SiMe₃)] (4, 6 and 7).

In ³¹P NMR spectra sharp signals at 19.5 (**4**), 72.4 (**6**) and -133.8 (**7**) ppm have been found. ¹H and ¹³C NMR spectra of **4** are very similar to those ones of **3** with exception of THF signals. The ¹H NMR spectra of paramagnetic complexes **6** and **7** show sharp signals and can be easily assigned. Thus, *tert*-butyl groups signals are upfield-shifted at -2.68 (**6**) and -7.19 (**7**) ppm, whereas trimethylsilyl groups signals are slightly high-field-shifted for **6** at -4.34 ppm and downfield-shifted for **7** at 1.53 ppm. The signals of phenyl groups are more or less downfield shifted depending on the distance from the paramagnetic centre. For the samarium complex **7** signal of methylene group is observed at 15.98 ppm, yet, for neodymium complex this signal could not be clearly assigned.

Reaction with phenylacetylene

The reaction of **4** with phenylacetylene was studied in order to prove the possibility of alkyl-abstraction from bis-(NPN)-alkyl complexes by a simple CH-acid. Complex **4** was prepared *in situ* from 1 eq. of $[Y(CH_2SiMe_3)_3(THF)_3]$ and 2 eq. of **1** and allowed to react with

9

1 eq. of phenylacetylene for 1 h at 0 °C. Alkynyl complex **8** forms selectively and has been isolated as a colourless, highly air- and moisture-sensitive solid in a high yield of 78%.

Scheme 5. Preparation of $[(NPN^{tBu})_2Y(C\equiv CPh)]$ 8.

In ³¹P NMR spectrum a singlet is observed at 17.8 ppm, that is upfield shifted compared to the starting complex 4 (19.5 ppm). The Ph<u>C</u>=CY singal is found as a doublet at 130.0 ppm with ${}^{2}J_{CY} = 36.2$ Hz, the carbon atom bonded to Y metal centre PhC=<u>C</u>Y is not observed in ¹³C NMR spectrum.

Reaction with N, N-dimethylanilinium tetrakis (pentafluorophenyl) borate

The reaction with the mild protonating $[PhNMe_2H]^+[B(C_6F_5)_4]^-$ proved to be highly selective method for the synthesis of cationic species by alkyl abstraction. The most suitable NMR solvent for this study is a 6:1 mixture of C_6D_6 :d₈-THF.

When mono-NPN dialkyl species **2** and **3** react with 1 eq. of $[PhNMe_2H]^+[B(C_6F_5)_4]^$ mono-alkyl cationic species $[(NPN'^{Bu})Ln(CH_2SiMe_3)(THF)_n]^+[B(C_6F_5)_4]^-$ (Ln = Sc (9) and Y (10)) are formed (Scheme 6). In case of bis-NPN mono-alkyl complex **4** formation of $[(NPN'^{Bu})_2Y(THF)_n]^+[B(C_6F_5)_4]^-$ **11** was observed (Scheme 7).

Scheme 6. Preparation of $[(NPN^{tBu})Ln(CH_2SiMe_3)(THF)_n]^+[B(C_6F_5)_4]^-$ (9 and 10).

Characterization of resulting cationic complexes 9–11 was carried out *via* NMR spectroscopy. All three complexes are formed selectively and rapidly as proven by immediate

formation of one equivalent of each PhNMe₂ and SiMe₄. Thus obtained ion-paired complexes are thermally stable and form in non-coordinating solvents insoluble oils.

Scheme 7. Preparation of $[(NPN^{tBu})_2Y(THF)_n]^+[B(C_6F_5)_4]^-$ 11.

The tetrakis-pentafluorphenyl borate-anions show as expected very similar NMR characteristics for all complexes. In ³¹P NMR spectra, the cations show for each complex one signal at 22.3 (9), 22.8 (10) and 23.5 (11) ppm, that in comparison to the starting compounds at 12.2 (2), 18.1 (3) and 18.1 (4) ppm are downfield shifted. ¹H and ¹³C NMR spectra show similar symmetric set of ligand signals as the precursor NPN-alkyl complexes. Coordination of THF molecules is clearly seen by additional set of signals next to the signals of deuterated THF residuals.

Stronger and shorter Ln-C bond character in cationic mono-alkyl NPN-complexes compared to their bis-alkyl neutral precursors manifests in ¹³C NMR spectra larger ${}^{1}J_{CY}$ coupling constants: 42.3 Hz in **10** vs. 38.7 Hz in **3** and downfield shifted Ln-<u>C</u>H₂: 47.5 ppm for **9** vs. 39.7 ppm for **2** and 34.4 ppm for **10** vs. 32.4 ppm for **3**.

Synthesis of bis-(NPN^{tBu}) chlorido rare-earth metal complexes

As shown above bis-(NPN^{tBu}) rare-earth metal alkyl complexes are easily accessible in highly pure form due to their crystallisation from n-pentane. In contrast, our initial attempts to synthesize chlorido complexes by reaction of 2 eq. of lithiated **1** with 1 eq. of [LnCl₃(THF)_m] led to product mixtures, difficult to separate, rather than to the desired pure chlorido postmetallocene [(NPN^{tBu})₂Ln-Cl]complexes. They offer reaction patterns complementary to those of the alkyls [(NPN^{tBu})₂Ln-R]. We found the simpliest synthetic approach to these chlorido complexes. This protocol includes *in-situ* formation of [(NPN^{tBu})₂Ln-CH₂SiMe₃] complexes as described above for **4**, **6** and **7**, their extraction into n-pentane or n-hexane, followed by quenching with dry chloroform. This leads to alkyl/Cl exchange (Scheme 8). As all [(NPN^{tBu})₂Ln-CH₂SiMe₃] complexes are highly soluble in alkanes, whereas [(NPN^{tBu})₂Ln-Cl] complexes are not, the latter precipitate from alkanes. They are collected via</sup>

centrifugation, decantation or filtration. Following this protocol rare-earth metal complexes of early lanthanides with relatively large atomic radii: Nd (14) and Sm (15), of the middle range lanthanides and yttrium: Gd (16), Tb (17) and Y (13), as well as late lanthanides with smaller atomic radii and scandium: Yb (18), Lu (19) and Sc (12) were obtained in high purity and in 33-85% yields.

Being easily accessible in pure form now all these complexes represent convenient platform for further investigation of a manifold of reactivity patterns, as they are soluble in benzene, toluene and ethers, crystalline and relatively stable against hydrolysis.

Scheme 8. Preparation of [(NPN^{*t*Bu})₂Ln-Cl] (12–19).

In the ³¹P NMR spectra of diamagnetic complexes sharp signals at 19.6 (12), 18.5 (13) and 20.0 (19) ppm are observed. These signals are in the same range as for bis-NPN alkyl complexes of yttrium 19.5 ppm (4) and scandium 19.6 (5). The paramagnetic complexes of Nd and Sm exhibit ³¹P NMR signals at -113.9 (14) and 81.8 (15) ppm, which are both downfield shifted compared to their NPN-alkyl analogues -133.8 (6) and 72.4 (7) ppm.

Molecular structures of bis-(NPNtBu) rare-earth metal alkyl and chlorido complexes

Single crystals of 4 (Y), 6 (Nd) and 7 (Sm) suitable for X-ray crystallography were obtained from a saturated n-pentane solution at -30 °C. All these alkyl-complexes are isostructural and crystallise in the monoclinic space group P21/n with four molecular units per cell unit (Fig.1). Selected bond lengths and angles of the compounds are presented in Table 1.

Fig. 1. Molecular structure of 7, one of the series of isostructural bis-NPN alkyl complexes $[(NPN^{tBu})_2Ln(CH_2SiMe_3)]$ (4, 6 and 7). The hydrogen atoms are omitted for clarity.

Crystallisation of chlorido complexes of Y (13) and Lu (19) was achieved from a saturated diethyl ether solution at room temperature. These complexes are isostructural and crystallise in the triclinic space group P-1 with two molecular units per cell unit (Fig. 2.). Selected bond lengths and angles of the compounds are presented in Table 1.

Fig. 2. Molecular structure of **19**, one of two isostructural bis-NPN chlorido complexes $[(NPN^{tBu})_2Ln-Cl]$ (Ln = Y **13** and Lu **19**). The hydrogen atoms are omitted for clarity.

Ln–N bond lengths 2.307(3)–2.407(3) Å for 4, 2.400(3)–2.501(3) Å for 6 and 2.370(3) –2.476(3) Å for 7 lie between representative covalent¹⁹ and donor-acceptor²⁰ bonds. They are also in the same range as for other type **A** and **B** mono- and bis-NPN complexes, for example: in [{Ph₂P(NMes)(NPh)}Y(CH₂SiMe₃)₂(THF)]: d(Y-N) = 2.335(3) and 2.349(4) Å,^{6a,b} in [{Ph₂P(NSiMe₃)₂}Sm(µ₂-I)₂]Li(THF): d(Sm-N) = 2.384(3)-2.506(4) Å³ or in [{Ph₂P(NSiMe₃)₂}Nd(COT)(THF)]: d(Nd-N) = 2.472(3) and 2.473(3) Å.⁴ The Ln–C bond lengths are within the expected range for Ln-CH₂SiMe₃ derivatives.²¹

As expected Y–N bond lengths in chlorido complex **13** with more electron-poor central atom are significantly shorter than in corresponding alkyl complex **4**. Y–N distance

range in alkyl complex 4 is 2.307(3)-2.407(3) Å and only 2.291(2)-2.385(2) Å in chlorido complex 13.

It is well known that upon sublimation, $[Cp_2Ln(THF)Cl]$ complexes lose coordinated THF to form dimeric species with two μ -Cl ligands $[(Cp_2Ln-Cl)_2]$.²² Similar behavior is observed in the case of Cp* complexes,²³ yet $[(Cp*_2YCl)_2]$ species does exist as asymmetric dimer with only one μ -Cl ligand.²⁴ For the smallest among rare-earth metals, scandium, formation of monomeric $[Cp*_2ScCl]$ was described.²⁵ The fact, that we isolated ether-free penta-coordinate corresponding $[(NPN^{tBu})_2LnCl]$ complexes from solution containing the probe ligands - diethyl ether and THF - indicates the very strong donor character of this NPN^{tBu} ligand. Despite of its different steric shielding the title ligand electron donating ability is probably best compared to (or even higher than) the most prominent ligand in lanthanocene chemistry $[C_5Me_5, Cp*]$.

Strong similarity between the N–P bond lengths in alkyl complexes ($\Delta = 0.005(3)$ Å for 4, $\Delta = 0.004(3)$ Å for 6 and $\Delta = 0.007(4)$ Å for 7) indicates perfect electron delocalization within N–P–N ligand fragment. Yet, in chlorido complexes these difference are significantly larger ($\Delta = 0.023(2)$ Å for 13, $\Delta = 0.019(4)$ Å for 19) indicating less pronounced delocalization.

In all complexes N–Ln–N bond angles within each pair of coordinated NPN ligands differ insignificantly and are in a similar range as for other structurally characterised complexes.^{6a,b}

Our attempt to get suitable single crystals of scandium derivative **12** by crystallisation from the C₆D₆ solution in the NMR tube at room temperature resulted in the determination of the molecular structure of a new trinuclear complex [$\{(NPN^{tBu})Sc(\mu_2-Cl)\}_3(\mu_3-O)(\mu_3-Cl)\}$] **20** (Fig. 3) as the product of partial hydrolysis of **12** by water traces. One NPN^{tBu} ligand per scandium summing up to three negative charges per trinuclear unit are replaced by three negative charges of capping oxido and chlorido ligands.

Complex **20** crystallises in the triclinic space group $P \ \overline{1}$ with two formula units and six benzene molecules incorporated per unit cell. A representative set of bond lengths (Å) and angles (°) for complex **20** is given in Table 2.

Fig. 3. Molecular structure (left) and valence-bond formula (right) of compound **20**. Hydrogen atoms and the solvent molecules are omitted for clarity.

Trinuclear rare-earth metal complexes with a similar μ_3 -O capping structural motif have been described in the literature. Examples are shown in Chart 3.²⁶

The basic framework of this structure is formed by the three scandium atoms, that are above and below capped *via* a μ_3 -O and μ_3 -Cl atoms. Other three chlorido atoms are μ_2 -bridging the edges of the Sc₃-triangle so that a highly distorted six-membered ring is formed

(Fig. 3, left). Thus, the shortest Sc- μ_3 -Cl distance (2.717(1) Å) is even longer than the longest Sc- μ_2 -Cl one (2.565(1) Å). The Sc–Cl bond distances are similar to those of other scandium complexes, bearing μ_2 -Cl atoms, e.g. in [{N(SiMe_2H)_2}_2Sc(μ_2 -Cl)(THF)]_2 d(Sc–Cl) = 2.559 Å²⁷ and in [Cp₂Sc(μ_2 -Cl)]_2 d(Sc–Cl) = 2.573 Å.²⁸ No crystallographically characterised molecular scandium compound with a μ_3 -Cl motif is known to date. The Sc–O distance lies in the range of 2.024(2) - 2.034(3) Å and significantly shorter than that one in **XIV** (2.066 Å). Due to the shorter Sc– μ_3 -O compared to Sc– μ_3 -Cl distances corresponding Sc–(μ_3 -Cl)–Sc angles (69.8(1) - 72.4(1)°) become smaller than Sc–(μ_3 -O)–Sc ones (104.2(1) - 105.4(1)°).

Conclusions

So far iminophosphonamido complexes of the rare-earth metals were limited to derivatives with two electron withdrawing N-silyl or N-aryl substituents, no such N,N'-dialkyl derivatives have been studied in detail. The relative stability of *tert*-butyl azide used in the Staudinger type of ligand synthesis prompted us to investigate bis-*tert*-butyl derivatives NPN^{*t*Bu} and their potential to act as easily accessible, crystalline and sterically most demanding ligands with so far highest NPN donor strength within this class of complexes. We are convinced, that the prominent donor strength, the steric demand as well as favourable solubility and NMR spectroscopic features make these post-metallocene complexes [(NPN^{*t*Bu})₂Ln-X] to building blocks as useful as the lanthanocenes [(C₅Me₅)₂Ln-X] in their further exploration.

Experimental part

General remarks

All syntheses were performed using Schlenk equipment under argon (grade 5.0) that was additionally freed of oxygen traces at Al_2O_3/Na SOLVONA column and dried of water traces at P_4O_{10} column. Weighing and sample preparation for analytical characterization, as well as materials storage was performed in a glove box under atmosphere of dry nitrogen. Drying of solvents and reagents used was carried out by the general methods under an inert atmosphere. The solvents were after drying stored in absorption columns over BASF alumina molecular sieve 3Å/R3-11G catalyst. Solvent and all chemicals used in the syntheses were, unless mentioned separately purchased from Fluka, Aldrich, Acros, Sigma or Merck. Rare-earth metal salts or corresponding oxides were purchased from Chempur. The following starting materials were synthesized by literature methods: $tBuN_3$,²⁹ [LnCl₃(THF)_n] (Ln = Sc, Y, Nd

and Sm) and [LnCl₃] (Ln = Gd, Tb, Yb and Lu),³⁰ [Ln(CH₂SiMe₃)₃(THF)₂]: Ln = Sc,³¹ Lu³² and [Y(CH₂SiMe₃)₃(THF)₃].³³ The concentrations of the solutions used by organolithium and Grignard reagents were determined by titration with *sec*-butanol and 1,10-phenanthroline as indicator. Because of the strong paramagnetic behaviour measuring of ¹³C NMR spectra of **6**, **7**, **14–18** and ¹H NMR spectra for **16** and **18** did not make sense. Additional metal titration (with Xylenol orange as indicator) for **16–19** was fulfilled.

Synthesis of Ph₂P(=N-*t*Bu)(NH-*t*Bu) (1)

For working with gram quantities of $tBuN_3$ an extra safety shield is recommended. Despite of its relative high stability compared to highly explosive primary and secondary alkyl azides only glass and plastic needles were used.

To an ice-cooled solution of dry tBuNH₂ (13.1 mL, 125 mmol, 2.5 eq.) in dry CH₂Cl₂ (200 mL), under vigorous stirring and argon overflow a solution of Ph₂PCl (9 mL, 50 mmol, 1.0 eq.) in dry CH₂Cl₂ (50 mL) was added drop-wise and then allowed to warm up to ambient temperature. After stirring for 4 h the reaction solvent with some excess of tBuNH₂ was removed and an oily residue was extracted with dry toluene (300 mL) followed by filtration of tBuNH₃Cl salt precipitate (D4), solvent removal and drying under high vacuum to get crude Ph₂PNHtBu as light-coloured viscous oil, that was purified by quick bulb-to-bulb distillation under dynamic high vacuum giving pure semi-product Ph₂PNHtBu (9 g, 35 mmol) in 70% yield. The latter was dissolved in THF (100 mL) followed by addition of $tBuN_3$ (5 g, 50 mmol, 1.5 eq.) at ambient temperature and allowed to stir over night. Next day formation of a fine, voluminous solid was observed. The reaction mixture was heated to reflux under stirring whereupon the precipitate goes into solution with gas evolution. Once, after about 4 h the latter ceased, the reaction mixture was cooled and the solvent was removed under high vacuum (Caution! Thus removed solvent still contains some $tBuN_3$. For its decomposition it should be treated by triethylphosphite before disposal). The solid was suspended in 100 ml of n-hexane, the solution was decanted and the solid dried under high vacuum to give 9.7 g of 1 as a white solid in 85% (overall $\sim 60\%$) yield. 1 sparingly soluble in n-pentane and n-hexane, but soluble in benzene, toluene and ethers.

CHN: (C₂₀H₂₉N₂P, MW: 328.43): found (calcd.): C: 73.01% (73.14%), H: 9.02% (8.90%), N: 8.39% (8.53%).

¹**H** NMR (300.1 MHz, C₆D₆): δ = 1.35 (br s, 18H, *t*Bu*H*), 2.53 (br s, 1H, N*H*), 7.06–7.11 (m, 6H, *m-/p*-Ph*H*), 7.83–7.90 (m, 4H, *o*-Ph*H*) ppm. ¹³**C** NMR (75.5 MHz, C₆D₆): δ = 33.9 (br s, *t*BuC_{Me}), 51.8 (d, ²*J*_{CP} = 3.7 Hz, *t*BuC_q), 127.9 (d, overlapped with residual C₆D₆ signal, *p*-Ph*C*), 133.0 (d, ³*J*_{CP} = 2.7 Hz, *m*-Ph*C*), 132.5 (d, ²*J*_{CP} = 9.4 Hz, *o*-Ph*C*), 139.4 (d, ¹*J*_{CP} = 125.3 Hz, *ipso*-Ph*C*) ppm. ³¹**P** NMR (121.5 MHz, C₆D₆): δ = -21.9 (s) ppm.

General synthetic protocols to rare-earth metal NPN-alkyl complexes

A1: $[Ln(CH_2SiMe_3)_3(THF)_n]$ (0.5 mmol, 1 eq.) was dissolved in n-hexane (10 mL). A pre cooled 0 °C solution of 1 (0.5 mmol, 1.0 eq. or 1.0 mmol, 2 eq.) in diethyl ether (10 mL) was slowly added drop-wise at 0 °C and stirred for 2.5 h.

A2: $[LnCl_3(THF)_n]$ (0.5 mmol, 1 eq.) was suspended in n-hexane (10 mL), cooled to 0 °C and followed by drop-wise addition of LiCH₂SiMe₃ (1.5 mmol, 3 eq.) solution in n-hexane (3 mL) *via* syringe. After stirring for 3 h at 0 °C a solution of **1** (0.5 mmol, 1.0 eq. or 1.0 mmol, 2 eq.) in diethyl ether (20 mL) was slowly added. After stirring for 2.5 h the reaction mixture was concentrated to one-half, treated with 10 mL of n-pentane and filtered through Celite[®]. The work-up was carried out differently and is additionally detailed below for each case. The solids are moderately soluble in n-hexane, but soluble in benzene, toluene and ethers.

Synthesis of [(NPN^{tBu})Sc(CH₂SiMe₃)₂] (2)

According to A1: from $[Sc(CH_2SiMe_3)_3(THF)_2]$ (225 mg, 0.50 mmol, 1 eq.) with 1 (164 mg, 0.50 mmol, 1 eq.).

According to A2: from [ScCl₃(THF)₃] (186 mg, 0.50 mmol, 1 eq.) with LiCH₂SiMe₃ (140 mg, 1.49 mmol, 2.98 eq.) and 1 (163 mg, 0.49 mmol, 0.99 eq.).

Work-up is the same for A1 and A2: Thus obtained solution was concentrated under high vacuum to a volume of ca. 1.5-2 mL and allowed to crystallise overnight at -30 °C, the supernatant in the cold was decanted and the residue dried under high vacuum to give 2 as colourless, powdery solid. Yields: A1) 219 mg (80%), A2) 190 mg (70%).

CHN: (C₂₈H₅₀N₂PScSi₂, MW: 546.81): found (calcd.): C: 60.49% (61.50%), H: 9.01% (9.22%), N: 5.14% (5.12%).

¹**H NMR** (300.1 MHz, C₆D₆): $\delta = 0.25$ (s, 4H, Sc-CH₂), 0.45 (s, 18H, SiMe₃), 1.11 (d, ⁴J_{HP} = 1.2 Hz, 18H, *t*BuH), 7.05–7.08 (m, 6H, *m-/p*-PhH), 7.84–7.91 (m, 4H, *o*-PhH) ppm. ¹³**C NMR** (75.5 MHz, C₆D₆): $\delta = 4.2$ (s, SiMe₃), 34.3 (d, ³J_{CP} = 8.1 Hz, *t*BuC_{Me}), 39.7 (br s, Sc-CH₂), 54.3 (d, ²J_{CP} = 1.6 Hz, *t*BuC_q), 128.5 (d, overlapped with residual C₆D₆ signal, *p*-PhC), 131.9 (d, ³J_{CP} = 2.9 Hz, *m*-PhC), 133.1 (d, ¹J_{CP} = 90.1 Hz, *ipso*-PhC), 133.3 (d, ²J_{CP} = 10.5 Hz, *o*-PhC) ppm.

³¹**P** NMR (121.5 MHz, C_6D_6): $\delta = 12.2$ (s) ppm.

IR: $\tilde{v} = 432$ (s), 532 (s), 553 (s), 607 (s), 618 (s), 678 (s), 698 (s), 718 (s), 743 (s), 772 (s), 834 (s), 1027 (s), 1089 (s), 1109 (s), 1195 (s), 1217 (s), 1237 (m), 1251 (m), 1311 (w), 1360 (s), 1387 (m), 1436 (m), 1465 (w), 1483 (w), 2801 (w), 2859 (m), 2894 (m), 2945 (s), 3055 (w), 3076 (w) cm⁻¹.

Synthesis of [(NPN^{tBu})Y(CH₂SiMe₃)₂(THF)] (3)

According to A1: from $[Y(CH_2SiMe_3)_3(THF)_3]$ (283 mg, 0.5 mmol, 1 eq.) with 1 (164 mg, 0.5 mmol, 1 eq.). Work-up: The solvent was completely removed under high vacuum. The colourless residue was treated with n-hexane (3 mL), crystallised at -30 °C overnight and the solution was decanted in the cold. The solid was washed with pre-cooled n-hexane at -30 °C (5 mL) and dried under high vacuum to give **3** as a colourless solid. Yield: 97 mg (29%).

CHN: (C₃₂H₅₈N₂OPSi₂Y, MW: 662.87): found (calcd.): C: 53.68% (57.98%), H: 8.36% (8.82%), N: 4.34% (4.23%).

¹**H** NMR (300.1 MHz, C₆D₆): $\delta = -0.26$ (d, ²*J*_{HY} = 3.0 Hz, 4H, Y-C*H*₂), 0.45 (s, 18H, Si*Me*₃), 1.12 (d, ⁴*J*_{HP} = 0.9 Hz, 18H, *t*Bu*H*), 1.32–1.36 (br m, 4H, thf-C*H*₂), 3.90–3.95 (br m, 4H, thf-OC*H*₂), 7.10–7.23 (m, 6H, *m-/p*-Ph*H*), 8.12–8.19 (m, 4H, *o*-Ph*H*) ppm.

¹³C NMR (1k, 75.5 MHz, C₆D₆): $\delta = 5.1$ (s, SiMe₃), 25.2 (s, thf-CH₂), 32.4 (d, ${}^{1}J_{CY} = 38.7$ Hz, Y-CH₂), 34.9 (d, ${}^{3}J_{CP} = 8.9$ Hz, tBuC_{Me}), 52.9 (d, ${}^{2}J_{CP} = 0.9$ Hz, tBuC_q), 70.2 (s, thf-OCH₂), 128.2 (d, ${}^{4}J_{CP} = 11.0$ Hz, p-PhC), 130.8 (d, ${}^{3}J_{CP} = 2.9$ Hz, m-PhC), 133.4 (d, ${}^{2}J_{CP} = 9.7$ Hz, o-PhC), 137.0 (d, ${}^{1}J_{CP} = 84.9$ Hz, *ipso*-PhC) ppm.

³¹**P** NMR (121.5 MHz, C_6D_6): $\delta = 18.1$ (s) ppm.

IR: $\tilde{v} = 497$ (s), 530 (s), 597 (s), 672 (s), 698 (s), 712 (s), 743 (s), 762 (s), 833 (s), 1020 (s), 1094 (s), 1193 (s), 1234 (s), 1248 (s), 1312 (w), 1359 (s), 1387 (m), 1436 (s), 1462 (w), 1482 (w), 2898 (m), 2943 (s), 3055 (w) cm⁻¹.

Synthesis of [(NPN^{tBu})₂Y(CH₂SiMe₃)] (4)

According to A1: from $[Y(CH_2SiMe_3)_3(THF)_3]$ (283 mg, 0.5 mmol, 1 eq.) with 1 (328 mg, 1 mmol, 2 eq.).

According to A2: from [YCl₃(THF)_{3.5}] (206 mg, 0.5 mmol, 1 eq.) with LiCH₂SiMe₃ (141 mg, 1.5 mmol, 3 eq.) and **1** (328 mg, 1 mmol, 2 eq.).

Work-up is the same for A1 and A2: The solvent was removed under high vacuum, the colourless residue was dissolved in n-hexane (3 mL) and crystallised at -30 °C overnight and the solution was decanted in the cold. The residue was washed with pre-cooled at -30 °C n-hexane (5 mL) and dried under high vacuum to give 4 as a microcrystalline, colourless solid. Single crystals were obtained from a concentrated n-pentane solution at -30 °C. Yields: A1) 379 mg (91%), A2) 353 mg (85%).

CHN (C₄₄H₆₇N₄P₂SiY, MW: 830.97): found (calcd.): C: 63.33% (63.60%), H: 8.79% (8.13%), N: 6.61% (6.74%).

¹**H NMR** (300.1 MHz, C₆D₆): $\delta = 0.19$ (d, ²*J*_{HY} = 3.0 Hz, 2H, Y-C*H*₂), 0.58 (s, 9H, Si*Me*₃), 1.30 (s, 36H, *t*Bu*H*), 7.14–7.24 (m, 12H, *m*-/*p*-Ph*H*), 8.21–8.28 (m, 8H, *o*-Ph*H*) ppm.

¹³C NMR (75.5 MHz, C₆D₆): $\delta = 5.7$ (s, Si*Me*₃), 29.6 (d, ${}^{1}J_{CY} = 40.4$ Hz, Y-*C*H₂), 35.6 (d, ${}^{3}J_{CP} = 9.0$ Hz, *t*BuC_{Me}), 53.2 (s, *t*BuC_q), 128.3 (d, overlapped with residual C₆D₆ signal, *p*-PhC), 130.8 (d, ${}^{3}J_{CP} = 2.7$ Hz, *m*-PhC), 133.8 (d, ${}^{2}J_{CP} = 9.6$ Hz, *o*-PhC), 137.4 (d, ${}^{1}J_{CP} = 83.5$ Hz, *ipso*-PhC) ppm.

IR: $\tilde{v} = 467$ (s), 531 (s), 595 (s), 671 (s), 697 (s), 711 (s), 744 (s), 833 (s), 863 (s), 1026 (s), 1086 (s), 1192 (s), 1226 (m), 1260 (m), 1311 (w), 1359 (m), 1387 (m), 1435 (m), 1462 (w), 1482 (w), 2860 (m), 2955 (m), 3053 (w) cm⁻¹.

Synthesis of [(NPN^{tBu})₂Sc(CH₃)(THF)] (5)

[ScCl₃(THF)₃] (184 mg, 0.5 mmol, 1 eq.) and **1** (328 mg, 1 mmol, 2 eq.) were dissolved in diethyl ether (15 mL) and cooled to 0 °C and MeLi (0.94 mL as 1.6 M diethyl ether solution, 1.5 mmol, 3 eq.) was added *via* syringe. After stirring for 1 h at 0 °C the mixture was filtered through Celite[®]. Upon solvent removal the residue was dried in vacuum, washed with n-pentane (3 mL) to give **5** as a colourless solid. Yield: 233 mg (59%).

CHN: (C₄₅H₆₇N₄OP₂Sc, MW: 786.94): found (calcd.): C: 62.96% (68.68%), H: 7.98% (8.58%), N: 6.75% (7.12%).

¹**H NMR** (300.1 MHz, C₆D₆): $\delta = 0.61$ (s, 3H, Sc-CH₃), 1.37 (s, 40H, *t*BuH + thf-CH₂), 3.54–3.59 (s, 4H, thf-OCH₂), 7.15–7.19 (m, 12H, *m-/p*-PhH), 8.26–8.34 (m, 8H, *o*-PhH) ppm. ¹³**C NMR** (4k, 62.9 MHz, C₆D₆): $\delta = 22.8$ (s, Sc-CH₃), 25.7 (s, thf-CH₂), 35.2 (d, ³J_{CP} = 8.7 Hz, *t*BuC_{Me}), 53.8 (d, ²J_{CP} = 0.9 Hz, *t*BuC_q), 68.0 (s, thf-OCH₂), 127.9 (d, overlapped with residual C₆D₆ signal, *p*-PhC), 130.8 (d, ³J_{CP} = 2.9 Hz, *m*-PhC), 134.2 (d, ²J_{CP} = 9.7 Hz, *o*-PhC), 137.1 (d, ¹J_{CP} = 83.4 Hz, *ipso*-PhC) ppm.

³¹**P** NMR (121.5 MHz, C_6D_6): $\delta = 19.6$ (s) ppm.

IR: $\tilde{v} = 407$ (s), 433 (s), 466 (s), 531 (s), 598 (s), 619 (w), 672 (s), 697 (s), 712 (s), 744 (s), 759 (s), 833 (s), 914 (w), 998 (m), 1027 (m), 1084 (s), 1192 (s), 1219 (m), 1310 (w), 1357 (m), 1386 (m), 1434 (m), 1459 (w), 1481 (w), 2952 (m), 3053 (w) cm⁻¹.

Synthesis of [(NPNtBu)2Nd(CH2SiMe3)] (6)

According to A2: from $[NdCl_3THF)_2]$ (197 mg, 0.5 mmol, 1 eq.) with LiCH₂SiMe₃ (141 mg, 1.5 mmol, 3 eq.) and 1 (328 mg, 1 mmol, 2 eq.). Since low stability of Nd tris-alkyl complex is known, the ligand was added already after 1 h. Work-up: The solvent was removed under high vacuum and the residue was washed with cold n-pentane (3 mL) to give 6 as a blue solid. Single crystals were obtained from a concentrated n-pentane solution at -30 °C. Yield: 93 mg (21%).

CHN: (C₄₄H₆₇N₄NdP₂Si, MW: 886.30): found (calcd.): C: 61.30% (59.63%), H: 8.20% (7.62%), N: 6.72% (6.32%).

¹**H** NMR (300.1 MHz, C₆D₆): $\delta = -7.19$ (br s, 36H, *t*Bu*H*), -4.34 (s, 9H, Si*Me*₃), 9.84 (t, ³*J*_{HH} = 6.7 Hz, 4H, *p*-Ph*H*), 10.59 (m, 8H, *m*-Ph*H*), 19.66 (d, ³*J*_{HH} = 3.8 Hz, 8H, *o*-Ph*H*) ppm. The signal of Nd-CH₂ hydrogen atoms could not be clearly identified.

³¹**P** NMR (121.5 MHz, C_6D_6): $\delta = -133.8$ (br s) ppm.

Synthesis of [(NPN^{tBu})₂Sm(CH₂SiMe₃)] (7)

According to A2: from $[SmCl_3(THF)_2]$ (200 mg, 0.5 mmol, 1 eq.) with LiCH₂SiMe₃ (141 mg, 1.5 mmol, 3 eq.) and 1 (328 mg, 1 mmol, 2 eq.). Since low stability of Sm tris-alkyl complex is known, the ligand was added already after 1 h. Work-up: The solvent was removed under high vacuum and the residue was washed with cold n-pentane (3 mL) to give 7 as a yellow solid. Single crystals were obtained from a concentrated n-pentane solution at -30 °C. Yield: 186 mg (42%).

22

CHN: (C₄₄H₆₇N₄P₂SiSm, MW: 892.42): found (calcd.): C: 58.73% (59.22%), H: 7.67% (7.57%), N: 6.02% (6.28%).

¹**H NMR** (300.1 MHz, C₆D₆): $\delta = -2.68$ (s, 36H, *t*Bu*H*), 1.53 (s, 9H, Si*Me*₃), 8.02 (br t, ${}^{3}J_{\text{HH}} = 7.3$ Hz, 4H, *p*-Ph*H*), 8.27 (br t, ${}^{3}J_{\text{HH}} = 7.3$ Hz, 8H, *m*-Ph*H*), 11.79 (d, ${}^{3}J_{\text{HH}} = 6.7$ Hz, 8H, *o*-Ph*H*), 15.98 (br s, 2H, Sm-C*H*₂) ppm.

IR: $\tilde{v} = 466$ (m), 530 (s), 594 (s), 669 (s), 697 (s), 711 (s), 743 (s), 831 (s), 859 (s), 953 (w), 1027 (s), 1092 (s), 1194 (s), 1261 (s), 1310 (s), 1359 (s), 1386 (s), 1434 (s), 1461 (s), 1481 (s), 2860 (s), 2900 (s), 2954 (s), 3053 (s) cm⁻¹.

Synthesis of [(NPN^{tBu})₂Y-C≡CPh] (8)

To $[Ln(CH_2SiMe_3)_3(THF)_2]$ (0.5 mmol, 1 eq.) a solution of **1** (0.5 mmol, 1.0 eq. or 1.0 mmol, 2 eq.) in diethyl ether (10 mL) was slowly added drop-wise at 0 °C and stirred for 2.5 h. $[Y(CH_2SiMe_3)_3(THF)_3]$ (283 mg, 0.5 mmol, 1 eq.) was suspended in n-pentane (10 mL) at 0 °C followed by addition of **1** (328 mg, 1 mmol, 2 eq.) as a solution in diethyl ether (5 mL).

The reaction mixture was stirred at 0 °C for 3 h. Subsequently phenylacetylene (54.9 μ L, 0.5 mmol, 1 eq.) was syringed at 0 °C. The solution turned yellow and after 1 h at 0 °C was allowed to stand overnight at –30 °C for crystallisation. After decanting the product washed with pre-cooled n-pentane (2 x 4 mL). Drying in a high vacuum, gave **8** as a colourless powder solid. Yield: 330 mg (78%).

CHN: (C₄₈H₆₁N₄P₂Y, MW: 844.34): found (calcd.): C: 68.24% (67.57%), H: 7.28% (7.53%), N: 6.63% (5.78%).

¹**H** NMR (300.1 MHz, C₆D₆): δ = 1.40 (s, 36H, C(CH₃)₃), 7.00–7.13 (m, 12H, *m-/p*-PhH and *m-/p*-PhH-Alkynyl), 7.77 (dd, ³J_{HH} = 8.3 Hz, ⁴J_{HH} = 1.3 Hz, 2H, *o*-PhH-Alkynyl), 8.26–8.33 (m, 8H, *o*-PhH) ppm.

¹³**C NMR** (4k, 62.9 MHz, C₆D₆): $\delta = 35.2$ (d, ³ $J_{CP} = 8.8$ Hz, $tBuC_{Me}$), 53.4 (d, ² $J_{CP} = 1.2$ Hz, $tBuC_q$), 108.2 (s, *ipso*-PhC-Alkynyl), 125.8 (s, *p*-PhC-Alkynyl), 127.9 (s, *m*-PhC-Alkynyl), 128.4 (d, ⁴ $J_{CP} = 16.6$ Hz, *p*-PhC), 130.0 (d, ² $J_{CY} = 36.2$ Hz, PhC=CY), 130.8 (d, ³ $J_{CP} = 2.8$ Hz, *m*-PhC), 132.6 (s, *o*-PhC-Alkynyl), 133.8 (d, ² $J_{CP} = 9.9$ Hz, *o*-PhC), 136.9 (d, ¹ $J_{CP} = 84.0$ Hz, *ipso*-PhC) ppm. General protocol to reactions of alkyl complexes with [PhNMe₂H]+[B(C₆F₅)₄]-

A3: In the glove box a solution of $[PhNHMe_2]^+[B(C_6F_5)_4]^-$ (~50 µmol, 1.00 eq) in 0.1 mL C_6D_6 and 0.1 mL of THF-d⁸ was dropwise syringed to a solution of rare-earth metal NPN alkyl complex (~ 50 µmol, 1 eq.) in 0.3 mL of C_6D_6 . The reaction solution was transferred to a NMR tube, the reaction vessel was rinsed with 0.2 mL C_6D_6 , combined with thus transferred reaction solution and then analyzed by NMR spectroscopy.

Synthesis of $[(NPN^{tBu})Sc(CH_2SiMe_3)(THF)_n]^+[B(C_6F_5)_4]^-(9)$

According to A3: from 2 (30.73 mg 56.2 μ mol, 1.00 eq) with [PhNHMe₂]⁺[B(C₆F₅)₄]⁻ (44.06 mg, 55.0 μ mol, 0.98 eq.).

¹**H NMR** (400.0 MHz, C₆D₆/THF- d_8 , 6:1): $\delta = 0.00$ (s, 12H, Si Me_4), 0.17 (s, 9H, Si Me_3), 0.23 (s, 2H, Sc-C H_2), 0.89 (s, 18H, tBuH), 2.63 (s, 6H, aniline- Me_2), 6.64 (d, ${}^{3}J_{HH} = 8.2$ Hz, 2H, aniline-m-PhH), 6.72 (t, ${}^{3}J_{HH} = 7.1$ Hz, 1H, aniline-p-PhH), 7.18 (d, overlapping with residual C₆D₆ signal, 2H, aniline-o-PhH), 7.32–7.37 (m, 6H, o-/p-PhH), 7.86–7.91 (m, 4H, m-PhH) ppm.

¹³**C NMR** (100.6 MHz, C₆D₆/THF-*d*₈, 6:1): $\delta = -0.1$ (s, Si*Me*₄), 3.7 (s, Si*Me*₃), 33.8 (d, ${}^{3}J_{CP} = 7.9$ Hz, *t*BuC_{Me}), 40.2 (s, aniline-*Me*₂), 47.5 (br s, Sc-CH₂), 55.0 (d, ${}^{2}J_{CP} = 1.10$ Hz, *t*BuC_q), 113.0 (s, aniline-*m*-PhC), 116.9 (s, aniline-*p*-PhC), 125.2 (br m, *ipso*-C₆F₅), 128.9 (d, ${}^{4}J_{CP} = 11.7$ Hz, *p*-PhC), 129.3 (s, aniline-*o*-PhC), 132.2 (d, ${}^{1}J_{CP} = 89.5$ Hz, *ipso*-PhC), 132.8 (d, ${}^{3}J_{CP} = 2.8$ Hz, *m*-PhC), 133.5 (d, ${}^{2}J_{CP} = 10.3$ Hz, *o*-PhC), 137.1 (dm, ${}^{1}J_{CF} = 247.8$ Hz, *m*-C₆F₅), 139.0 (dm, ${}^{1}J_{CF} = 244.7$ Hz, *p*-C₆F₅), 149.15 (dm, ${}^{1}J_{CF} = 241.1$ Hz, *o*-C₆F₅), 151.1 (s, aniline-*ipso*-PhC) ppm.

¹⁹**F NMR** (376.3 MHz, C₆D₆/THF- d_8 , 6:1): $\delta = -167.4$ (br m, 8F, *m*-Ph*F*), -163.6 (br m, 4F, *p*-Ph*F*), -132.3 (br s, 8F, *o*-Ph*F*) ppm.

¹¹**B** NMR (128.3 MHz, C₆D₆/THF- d_8 , 6:1): $\delta = -16.3$ (s) ppm.

Synthesis of $[(NPN^{tBu})_2Y(THF)_n]^+[B(C_6F_5)_4]^-(11)$

According to A3: from 4 (16.71 mg, 20.1 μ mol, 1 eq.) with [PhNHMe₂]⁺[B(C₆F₅)₄]⁻ (16.60 mg, 20.7 μ mol, 1 eq).

¹**H NMR** (400.0 MHz, C₆D₆/THF- d_8 , 6:1): $\delta = 0.00$ (s, 12H, Si Me_4), 1.02 (s, 36H, tBuH), 2.62 (s, 6H, aniline- Me_2), 6.64 (d, ${}^{3}J_{HH} = 8.3$ Hz, 2H, aniline-m-PhH), 6.73 (t, ${}^{3}J_{HH} = 7.3$ Hz, 1H, aniline-p-PhH), 7.19–7.21 (overlapping with residual C₆D₆ signal, 2H, aniline-o-PhH), 7.29–7.32 (m, 8H, m-PhH), 7.34–7.36 (m, 4H, p-PhH), 7.90–7.94 (m, 8H, o-PhH) ppm.

¹³C NMR (100.6 MHz, C₆D₆/THF- d_8 , 6:1): $\delta = -0.1$ (s, Si Me_4), 35.0 (d, ³ $J_{CP} = 8.5$ Hz, $tBuC_{Me}$), 40.2 (s, aniline- Me_2), 53.9 (d, ² $J_{CP} = 1.8$ Hz, $tBuC_q$), 113.0 (s, aniline-m-PhC), 116.9 (s, aniline-p-PhC), 128.7 (d, ⁴ $J_{CP} = 11.4$ Hz, p-PhC), 129.3 (s, aniline-o-PhC), 132.4 (d, ⁴ $J_{CP} = 5.3$ Hz, m-PhC), 133.6 (d, ² $J_{CP} = 10.1$ Hz, o-PhC), 150.1 (s, aniline-ipso-PhC) ppm. No signals of C_6F_5 -groups and of ipso-PhC are observed.

³¹**P NMR** (161.9 MHz, C₆D₆/THF- d_8 , 6:1): δ = 23.5 (s) ppm.

¹⁹**F NMR** (376.3 MHz, C₆D₆/THF- d_8 , 6:1): $\delta = -167.2$ (t, ${}^{3}J_{FF} = 17.8$ Hz, 8F, *m*-Ph*F*), -163.5 (t, ${}^{3}J_{FF} = 20.7$ Hz, 4F, *p*-Ph*F*), -132.1 (d, ${}^{3}J_{FF} = 10.4$ Hz, 8F, *o*-Ph*F*) ppm. ¹¹**B NMR** (128.3 MHz, C₆D₆/THF- d_8 , 6:1): $\delta = -16.3$ (s) ppm.

General synthetic protocol to rare-earth metal bis-NPN-chlorido complexes

A4: For $[ScCl_3(THF)_3]$, $[YCl_3(THF)_{3,5}]$, $[NdCl_3(THF)_2]$ and $[SmCl_3(THF)_2]$ simple suspensions of 0.50 mmol, 1 eq. in n-hexane (10 mL) were used. For anhydrous [LnCl₃]: Ln = Gd, Tb, Yb, Lu (0.50 mmol, 1 eq.) stirring with 20% THF in n-hexane (20 mL) overnight was used instead, followed by solvent removal and suspending the residue in n-hexane (10 mL). To thus obtained [LnCl₃(THF)_n] suspensions kept at 0 °C a solution of LiCH₂SiMe₃ (141 mg, 1.5 mmol, 3 eq.) in n-hexane (10 mL) was added drop-wise via syringe. After 3 hours (Sc, Y, Gd, Lu) or 1 h (Nd, Sm, Tb, Yb) stirring at 0 °C, assuming approx. 80% yield of tris-alkyl species, a solution of 1 (262 mg, 0.8 mmol, 2 eq.) in diethyl ether (10 mL) was syringed. After stirring for 2.5 h the reaction mixture was concentrated to one-half of its initial volume, treated with n-pentane (10 mL), filtered through Celite® and washed with n-pentane (10 mL). The solvent was removed in vacuum and the residue was extracted with n-pentane (20 mL) and treated with freshly dried over basic Al₂O₃ chloroform (0.5 mL) and allowed to stir overnight. Fine microcrystalline solids formed. The solvent was decanted and the solid washed with 5 ml of n-pentane and dried under high vacuum. The solids are nearly insoluble in n-pentane, sparingly soluble in hot n-hexane, soluble in benzene, toluene and ethers. Yields are calculated assuming the fact that only 80% (i.e. 0.4 mmol) of tris-alkyl species took part in the reaction with **1**.

Synthesis of [(NPN^{tBu})₂Sc-Cl] (12)

According to A4: from 184 mg of [ScCl₃(THF)₃] as a light-brown solid.

Yield: 97 mg (33%).

CHNCI: (C₄₀H₅₆ClN₄P₂Sc, MW: 735.26): found (calcd.): C: 63.32% (65.34%), H: 7.86% (7.68%), N: 7.33% (7.62%), Cl: 5.82% (4.82%).

¹**H** NMR (300.1 MHz, C₆D₆): $\delta = 1.41$ (s, 36H, *t*Bu*H*), 7.14–7.19 (m, 12H, *m-/p*-Ph*H*), 8.30–8.36 (m, 8H, *o*-Ph*H*) ppm.

¹³C NMR (75.5 MHz, C₆D₆): $\delta = 34.9$ (d, ${}^{3}J_{CP} = 8.4$ Hz, $tBuC_{Me}$), 54.5 (d, ${}^{2}J_{CP} = 1.2$ Hz, $tBuC_{q}$), 128.0 (d, overlapped with residual C₆D₆ signal, *p*-Ph*C*), 131.1 (d, ${}^{3}J_{CP} = 2.8$ Hz, *m*-Ph*C*), 134.4 (d, ${}^{2}J_{CP} = 10.0$ Hz, *o*-Ph*C*), 135.8 (d, ${}^{1}J_{CP} = 85.0$ Hz, *ipso*-Ph*C*) ppm. ³¹P NMR (121.5 MHz, C₆D₆): $\delta = 19.6$ (s) ppm.

IR: $\tilde{v} = 414$ (s), 469 (s), 533 (s), 600 (s), 672 (s), 699 (s), 713 (s), 745 (s), 761 (s), 834 (s), 998 (m), 1029 (s), 1068 (s), 1104 (s), 1190 (s), 1217 (m), 1358 (m), 1386 (m), 1435 (m), 1470 (w), 1482 (w), 2861 (m), 2899 (m), 2952 (m), 3052 (w) cm⁻¹.

Synthesis of [(NPN^{tBu})₂Y-Cl] (13)

According to A4: from 224 mg of $[YCl_3(thf)_{3.5}]$ as a light-brown solid. Yield: 150 mg (48%) CHNCI: (C₄₀H₅₆ClN₄P₂Y, MW: 779.21): found (calcd.): C: 59.44% (61.66%), H: 7.33%

(7.24%), N: 6.74% (7.19%), Cl: 4.93% (4.55%).

¹**H** NMR (300.1 MHz, C₆D₆): $\delta = 1.34$ (s, 36H, *t*Bu*H*), 7.14–7.20 (m, 12H, *m-/p*-Ph*H*), 8.22–8.29 (m, 8H, *o*-Ph*H*) ppm.

¹³C NMR (75.5 MHz, C₆D₆): $\delta = 35.1$ (d, ${}^{3}J_{CP} = 8.7$ Hz, $tBuC_{Me}$), 53.4 (s, $tBuC_{q}$), 128.3 (d, overlapped with residual C₆D₆ signal, *p*-Ph*C*), 130.9 (d, ${}^{3}J_{CP} = 2.7$ Hz, *m*-Ph*C*), 133.7 (d, ${}^{2}J_{CP} = 9.8$ Hz, *o*-Ph*C*), 136.6 (d, ${}^{1}J_{CP} = 84.8$ Hz, *ipso*-Ph*C*) ppm.

³¹**P** NMR (121.5 MHz, C_6D_6): $\delta = 18.5$ (s) ppm.

IR-Spektroskopie: $\tilde{v} = 467$ (s), 531 (s), 597 (s), 672 (s), 697 (s), 713 (s), 745 (s), 758 (s), 832 (s), 890 (w), 997 (m), 1027 (m), 1082 (s), 1103 (s), 1192 (s), 1216 (m), 1359 (m), 1386 (m), 1434 (m), 1468 (w), 1482 (w), 2860 (m), 2899 (m), 2950 (m), 3052 (w) cm⁻¹.

Synthesis of [(NPNtBu)2Nd-Cl] (14)

According to A4: from 197 mg of [NdCl₃(thf)₂] as a light-blue solid. Yield: 134 mg (40%).

CHNCI: (C₄₀H₅₆ClN₄P₂Nd, MW: 834.54): found (calcd.): C: 55.01% (57.57%), H: 7.13% (6.76%), N: 6.20% (6.71%), Cl: 4.61% (4.25%).

³¹**P** NMR (121.5 MHz, C_6D_6): $\delta = -113.9$ (br s) ppm.

IR: $\tilde{v} = 466$ (s), 529 (s), 555 (s), 597 (s), 670 (s), 697 (s), 713 (s), 743 (s), 754 (s), 830 (s), 996 (m), 1027 (m), 1092 (s), 1194 (s), 1217 (s), 1308 (w), 1360 (s), 1385 (m), 1434 (m), 1467 (w), 1481 (w), 2860 (m), 2899 (m), 2949 (m), 3053 (w) cm⁻¹.

Synthesis of [(NPNtBu)2Sm-Cl] (15)

According to A4: from 200 mg of $[SmCl_3(thf)_2]$ as a yellow solid. Yield: 188 mg (56%). CHNCl (C₄₀H₅₆ClN₄P₂Sm, MW: 840.66): found (calcd.): C: 55.14% (57.15%), H: 6.94% (6.71%), N: 6.55% (6.66%), Cl: 5.19% (4.22%). ¹H NMR (300.1 MHz, C₆D₆): $\delta = -2.28$ (s, 36H, *t*Bu*H*), 7.93–7.98 (m, 4H, *p*-Ph*H*), 8.11–8.13 (m, 8H, *m*-Ph*H*), 11.69 (s, 8H, *o*-Ph*H*) ppm. ³¹P NMR (121.5 MHz, C₆D₆): $\delta = 81.8$ (br s) ppm.

IR-Spektroskopie: $\tilde{v} = 464$ (s), 529 (s), 556 (m), 593 (s), 670 (s), 697 (s), 740 (s), 831 (s), 998 (w), 1027 (m), 1079 (s), 1093 (s), 1116 (s), 1190 (s), 1312 (w), 1360 (m), 1389 (m), 1435 (m), 1468 (w), 1482 (w), 2862 (w), 2959 (m), 3051 (w) cm⁻¹.

Synthesis of [(NPNtBu)2Gd-Cl] (16)

According to A4: from 132 mg of [GdCl₃] as a colourless solid. Yield: 236 mg (69%). CHNClGd: (C₄₀H₅₆ClN₄P₂Gd, MW: 847.55): found (calcd.): C: 56.04% (56.69%), H: 7.00% (6.66%), N: 6.61% (6.61%), Cl: 4.48% (4.18%). Gd: 18.45% (18.55%)

Synthesis of [(NPNtBu)2Tb-Cl] (17)

According to **A4**: from 133 mg of [TbCl₃] as a colourless solid. Yield: 272 mg (80%). **CHNCITb:** (C₄₀H₅₆ClN₄P₂Tb, MW: 849.24): found (calcd.): C: 55.97% (56.57%), H: 7.06% (6.66%), N: 6.51% (6.60%), Cl: 4.39% (4.17%). Tb: 18.61% (18.71%)

Synthesis of [(NPNtBu)2Yb-Cl] (18)

According to A4: from 140 mg of [YbCl₃] as a yellow solid. Yield: 121 mg (35%). CHNClYb (C₄₀H₅₆ClN₄P₂Yb, MW: 863.36): found (calcd.): C: 55.04% (55.65%), H: 6.99% (6.54%), N: 6.51% (6.49%), Cl: 4.31% (4.11%). Yb: 19.60% (20.04%) ¹H NMR (300.1 MHz, C₆D₆): $\delta = -18$ (br s, 36H, *t*Bu*H*), 6.5 (br m, 20H, Ph*H*) ppm. ³¹P NMR (121.5 MHz, C₆D₆): $\delta = -142.5$ (br s) ppm.

Synthesis of [(NPN^{tBu})₂Lu-Cl] (19)

According to A4: from 224 mg of [LuCl₃] as a colourless solid. Yield: 294 mg (85%). CHNCILu: (C₄₀H₅₆ClN₄P₂Lu, MW: 865.29): found (calcd.): C: 54.98% (55.52%), H: 6.69% (6.52%), N: 6.62% (6.47%), Cl: 4.40% (4.10%). Lu: 20.00% (20.22%) ¹H NMR (300.1 MHz, C₆D₆): $\delta = 1.30$ (s, 36H, *t*Bu*H*), 7.12–7.16 (m, 12H, *m-/p*-Ph*H*), 8.22–8.23 (m, 8H, *o*-Ph*H*) ppm.

¹³C NMR (75.5 MHz, C₆D₆): $\delta = 35.0$ (d, ${}^{3}J_{CP} = 8.6$ Hz, $tBuC_{Me}$), 53.4 (s, $tBuC_{q}$), 128.1 (d, overlapped with residual C₆D₆ signal, *p*-Ph*C*), 130.9 (d, ${}^{4}J_{CP} = 2.5$ Hz, *m*-Ph*C*), 133.7 (d, ${}^{2}J_{CP} = 10$ Hz, *o*-Ph*C*), 136.5 (d, ${}^{1}J_{CP} = 85$ Hz, *ipso*-Ph*C*) ppm.

³¹**P** NMR (121.5 MHz, C_6D_6): $\delta = 20.0$ (s) ppm.

X-ray crystallography

Crystal data were collected with different area-detector diffractometers using graphitemonochromatised Mo-K α -radiation ($\lambda = 0.71073$ Å), namely: for **4** and **6** with IPDS-2T at 100 K, for **7** and **20** with IPDS-II at 100K, for **13** and **19** with IPDS-I at 200K and 180K correspondingly. Data reduction was carried out using the IPDSI software or X-Area (Stoe).³⁴ Single crystals of complexes **4**, **6**, **7**, **13**, **19** and **20** were respectively mounted in Lindemann capillaries under nitrogen. The structures were solved by direct methods using SHELXS-97,³⁵ Sir-92,³⁶ and Sir-2004³⁷ programs and refined against F_o^2 by full-matrix least squares using SHELXL-97.³⁸ Details of the X-ray structure determinations are listed in Table 3. CCDC no. 1414805 (**4**), 1414808 (**6**), 1414807 (**7**), 901056 (**13**), 901055 (**19**) and 1414806 (**20*3C**₆**D**₆) contain the supplementary crystallographic data for this paper.

Table 3. Details of the X-ray structure determinations of complexes 4, 6, 7, 13, 19 and 20*3C₆D₆.

^a $R_1 = \Sigma ||F_o| - |F_c|| / \Sigma ||F_o|; w R_2 = [\Sigma w (F_o^2 - F_c^2)^2 / \Sigma w (F_o^4)]^{1/2}$

Acknowledgements

X-ray diffraction studies of complex 13 done by Dr. A. Spannenberg (LIKAT Rostock) and complex 19 done by Dr. B. Ziemer (HU-Berlin) are gratefully acknowledged. *K. A. Rufanov* thanks Ostpartnerschaftsprogram of the Deutscher Akademischer Austausch Dienst (DAAD) for financial support of collaboration with Philipps-Universität Marburg and would like to express appreciation to Dr. Andrei V. Churakov (Institute of General and Inorganic Chemistry, Russian Academy of Sciences) for his friendly assistance with correct refinement of the molecular structure of $20*3C_6D_6$. Financial support of the SPP-1166 of DFG, Chemetall GmbH and Studienstiftung des Deutschen Volkes (scholarship for *N. K. Hangaly, now Pruß*) are gratefully acknowledged. *N. K. Pruß* thanks Nicolas Frank for his contribution.
