This is an Accepted Manuscript, which has been through the Royal Society of Chemistry peer review process and has been accepted for publication.

Accepted Manuscripts are published online shortly after acceptance, before technical editing, formatting and proof reading. Using this free service, authors can make their results available to the community, in citable form, before we publish the edited article. We will replace this Accepted Manuscript with the edited and formatted Advance Article as soon as it is available.

You can find more information about Accepted Manuscripts in the Information for Authors.

Please note that technical editing may introduce minor changes to the text and/or graphics, which may alter content. The journal’s standard Terms & Conditions and the Ethical guidelines still apply. In no event shall the Royal Society of Chemistry be held responsible for any errors or omissions in this Accepted Manuscript or any consequences arising from the use of any information it contains.
Cinchona alkaloid catalyzed enantioselective sulfa-Michael/aldol cascade reaction of isoindigos: construction of chiral bispirooxindole tetrahydrothiophenes with vicinal quaternary spirocenters

Yong-Yuan Gui,a,b Jian Yang,a,b Liang-Wen Qi,a,b Xiao Wang,a,b Fang Tian,a Xiao-Nian Li,c Lin Peng,a,* and Li-Xin Wanga,*

A cinchona alkaloid catalyzed diastereoselective and enantioselective sulfa-Michael/aldol cascade reaction between 1,4-dithiane-2,5-diol and isoindigos has been successfully developed to afford the highly congested bispirooxindole tetrahydrothiophenes with vicinal quaternary spirocenters in high yields (up to 91%), excellent diastereoselectivities (up to >20:1 dr), and good enantioselectivities (up to 98% ee). Some synthetic transformations of the reaction products were also studied.

Introduction

The spirocyclic-oxindole scaffold is a privileged heterocyclic structure frequently found in a wide range of natural products.1 Accordingly, remarkable advances have been made for the stereoselective syntheses of the spirocyclic-oxindole skeletons.2,3 However, most of the synthetic targets are restricted to mono-spirooxindoles, and the catalytic enantioselective approaches toward the bispirooxindoles are limited, probably because of the challenges associated with the construction of the structurally more constrained bispirooxindole moiety and at least two quaternary spirocenters. Bispirooxindoles, fusing two oxindole rings into one cyclic molecule, may exhibit enhanced bioactivities than those of mono-spirooxindoles.4 Therefore, the development of new approaches to bispirooxindoles is highly appealing. So far, only a few methods,5 mainly confined to Michael cascade reaction between 3-substituted oxindoles and methyleneindolinones, for the catalytic enantioselective construction of bispirooxindoles have been reported. Typically, the Barbas group5a has pioneered an organocatalytic asymmetric domino Michael/aldol reaction between 3- substituted oxindoles and methyleneindolinones that afforded complex bispirooxindoles. More recently, isothiocyanato oxindoles5c-5g were used in Michael/cyclization sequence to prepare synthetically valuable bispirooxindole scaffolds (Scheme 1). Nevertheless, efficient catalytic enantioselective methods to access chiral bispirooxindoles with two vicinal quaternary spirocenters still remain rare.5-7

Scheme 1 Our strategy using isoindigo to construct structurally more rigid bispirooxindole with two contiguous quaternary spirocenters.

On the other hand, isoindigo, an isomer of the well-known dye indigo, has recently attracted considerable attentions as an electron-deficient building block for conjugated polymers.8 However, a survey of literatures found that there was no report on organocatalytic asymmetric Michael cascade reactions of isoindigo.9 Several challenges arise when isoindigo is used as a Michael accepter. One of the difficulties is its low reactivity due to steric congestion that is encountered in the carbon-carbon/heteroatom bond formation of nucleophilic addition with isoindigo. It is also difficult to achieve high levels of enantiotopic face selectivity because of relatively similar steric environments between the nonhydrogen substituents. Nevertheless, a successful organocatalytic asymmetric
Michael/cascade reaction of isoindigo would present another method for the construction of a family of chiral bispirooxindoles with vicinal quaternary stereocenters (Scheme 1). Moreover, tetrahydrothiophene structure embedded in target bispirooxindole is unique and has gained much attentions due to its diverse applications in chemistry and biology.\textsuperscript{10} Commercially available 1,4-dithiane-2,5-diol (the dimer of mercaptoacetaldehyde) is usually used to construct tetrahydrothiophene derivatives.\textsuperscript{11} Based on our former related work in chiral spiropicolane syntheses,\textsuperscript{12} we anticipated that the reaction of 1,4-dithiane-2,5-diol with isoindigo may be a straightforward way to construct oxindole-based bispirocyclic tetrahydrothiophenes through a Michael/aldol cascade reaction. Herein, we wish to report the first organocatalytic enantioselective Michael/aldol cascade reaction between 1,4-dithiane-2,5-diol and isoindigo with commercially available cinchona alkaloid as catalyst. This reaction readily afforded a family of enantioselective oxindole-based bispirocyclic tetrahydrothiophenes bearing highly congested contiguous quaternary stereocenters in up to 91\% yield, >20:1 dr, and 98\% ee.

**Results and discussion**

The initial investigation began with the model reaction between 1,4-dithiane-2,5-diol 1 and 1,1'-dimethyl isoindigo 2a using 10 mol\% quinine as catalyst in CHCl\textsubscript{3} at 30 °C (Figure 1). The sulfa-Michael/aldol cascade reaction proceeded smoothly and afforded the desirable product 3a in 65\% yield, with 72:28 dr and 66\% ee (Table 1, entry 1). Other cinchona bases were also tested. Among the catalysts, quinidine gave the best enantioselectivity with moderate yield and diastereoselectivity (79\% yield, 77:23 dr, 73\% ee, Table 1, entry 2). Other bifunctional thiourea and squaramide catalysts were also screened. All the catalysts gave poor enantioselectivities compared with quinidine (Table 1, entries 5-8 vs entry 2). Further screening of the solvents showed that less polar solvents such as toluene, mesitylene, tetrachloromethane gave better enantioselectivities (65-78\% ee, Table 1, entries 11, 14-15). However, strong polar solvents gave disappointing enantioselectivities (Table 1, entries 9-10). Of the screened solvents, mesitylene gave the best enantioselectivity (Table 1, entry 15) and was chosen for further investigations. Lowering the reaction temperature to 0 °C led to a slight decrease of enantioselectivity, yet a longer reaction time was required (Table 1, entry 16). Then the reaction was conducted at elevated temperature (50 °C), the enantioselectivity decreased dramatically (Table 1, entry 17). When 2 mL mesitylene was used, 84:16 dr and 80\% ee was obtained (Table 1, entry 18). The increase of 1,4-dithiane-2,5-diol loading improved the enantioselectivity from 80\% ee to 86\% ee (Table 1, entry 19 vs entry 18). Adding 50 mg MgSO\textsubscript{4} could slightly improve the diastereoselectivity of the reaction (Table 1, entry 20 vs entry 19). Further screening of catalyst loading, additives did not give better results (see SEI). Based on the comprehensive considerations of reaction time, yield, diastereoselectivity and enantioselectivity, the optimal reaction condition was established as: 0.1 mmol 1, 0.1 mmol 2a with 10 mol\% of quinidine, 50 mg MgSO\textsubscript{4} in 2 mL mesitylene at 30 °C.

</table>
Unless otherwise specified, the reaction was performed on a scale of 0.06 mmol 1 and 0.1 mmol 2a in 1 mL solvent at 30 °C. b Isolated yield. c Determined by isolated yield of two diastereoisomers. d Enantiomeric excess of the major diastereoisomer determined by chiral HPLC analysis. e The reaction was performed at 0 °C. f The reaction was performed at 50 °C. g 2 mL mesitylene was added. h The reaction was conducted with 0.1 mmol of 1. i 50 mg MgSO$_4$ was added. j Contrary configuration.

Under the optimized reaction conditions, the substrate scope of isoindigos was further evaluated. The substituents on nitrogen atom were firstly examined. All substituted isoindigos bearing different alkyl group worked well with excellent yields, diastereoselectivities and moderate to good enantioselectivities (78-91% yields, 82:18->20:1 dr, 69-87% ee, Table 2, entries 1-6, 8, 10). It was found that the bulky alkyl substituents on nitrogen atom to some extent favoured the diastereoselectivity (Table 2, entries 2-6, 8, 10 vs entry 1). Especially for 2c, only one diastereoisomer was obtained (>20:1 dr, Table 2 entry 3).

When cinchonine was used as catalyst, the reaction gave excellent diastereoselectivities and enantioselectivities (96:4 dr, 90% ee, 97:3 dr, 90% ee, Table 2, entries 7, 9). Additionally, isoindigos with different substitutions at C5-C7 positions reacted smoothly with 1,4-dithiane-2,5-diol, affording the desired products in 71-90% yield (Table 2, entries 11-18, 29-31). However, we found that halogen atom on the isoindigo aromatic ring has slight negative effects on the diastereoselectivity and enantioselectivity, and 1,1'-dipropyl-7,7'-difluoro-isoindigo 2l gave a mixture of almost equal quantities of two diastereoisomers, with 68% and 32% ee respectively (Table 2 entry 14). Electron-rich isoindigos 2i, 2n gave good to excellent enantioselectivity (82%, 98% ee respectively, Table 2, entries 11, 16). Generally, C6 substituted isoindigos gave better enantioselectivity than C5 substituted isoindigos (Table 2 entry 13 vs 12, entry 18 vs 17). N- unprotected isoindigo 2q gave no corresponding product after 72 hours, probably due to its poor solubility in mesitylene. The scope of the cascade reactions with unsymmetrical isoindigos was also examined (Table 2, entries 19, 20). However, unsymmetrical isoindigos gave complex products, probably due to the poor regioselectivity of the nucleophilic addition of mercaptoacetaldehyde to isoindigo. It is worth noting that configuration of the enantiomers of the bispirooxindole tetrahydrothiophenes could be correspondently obtained by switching the catalyst from quinidine to quinine. Under the similar reaction conditions, quinine gave the chiral bispirooxindole tetrahydrothiophenes with good yields, diastereoselectivities and enantioselectivities (70-83% yields, 78:22->20:1 dr, 71-88% ee, Table 2, entries 22-31).

To determine the relative and absolute configurations of the asymmetric sulfa-Michael/aldol addition products, a single crystal of compound 3k was obtained and the structure was confirmed by X-ray diffraction analysis. As shown in Figure 2, compound 3k contains a (C11R, C12R, C14S) configuration.\(^{13}\) Accordingly, the configurations of the other products in this work were tentatively assigned by assuming that a similar catalytic mechanism was followed.

Figure 2. X-ray structure of compound 3k.

According to the above data and previously reported dual activation model,\(^{14}\) we tentatively propose a working model as shown in Figure 3. The OH moiety of the catalyst activates the isoindigo via hydrogen bonding interaction. On the other hand, the tertiary amine of the catalyst would provide suitable...
basicity to enhance the nucleophilicity of the mercaptoacetaldehyde. The well-defined orientation facilitates the Si attack on the activated isoindigo. Subsequent intramolecular aldol reaction through the attack from the Re face of the aldehyde will create the corresponding product with (C11R, C12R, C14S)-configuration (Figure 3).

Some synthetic selective oxidations of the multifunctional products were also studied using different oxidants. Treatment protocol, efficiently catalyzed by commercially available between a variety of isoindigos and 1,4-dithiane-2,5-diol. The (CD (doublet), t (triplet), q (quartet), dd (double of doublet) or m)

intramolecular aldol reaction through the attack from the resonance as the internal standard (CDCl3).

General procedure for sulfa-Michael/aldol cascade reaction. A stirred solution of quinidine (10 mol%), 1,1'-dimethyl isoindigo 2a (0.10 mmol), MgSO4 (50 mg) in mesitylene (2.0 mL) at 30 °C was added 1,4-dithiane-2,5-diol 1 (0.1 mmol). The resulting reaction mixture was kept under vigorous stirring until the consumption of 2a (monitored by TLC analysis). After completion of the reaction, the reaction solution was concentrated in vacuo. The crude product was purified by column chromatography on silica gel to afford pure products 3a.

**Scheme 2** Synthetic applications of our approach. Reaction conditions: a) 3.0 eq PCC, DCM, rt, overnight; b) 3.0 eq m-CPBA, DCM, rt, overnight.

**Conclusions**

In summary, we have firstly developed a novel and simple organocatalytic thiol initiated Michael/aldol cascade reaction between a variety of isoindigos and 1,4-dithiane-2,5-diol. The protocol, efficiently catalyzed by commercially available quinidine, has successfully to be used to construct highly functionalized bispirooxindoles bearing tetrahydrothiophene motifs with generation of vicinal quaternary stereo centers in excellent yields (up to 91%), diastereoselectivities (up to >20:1 dr) and good enantioselectivities (up to 98% ee). Further investigation is under way to explore the reaction mechanism and expand the scope and application of this efficient cascade reaction.

**General methods**

Commercial grade solvent was dried and purified by standard procedures as specified in Purification of Laboratory Chemicals, 4th Ed (Armarego, W. L. F.; Perrin, D. D. Butterworth Heinemann: 1997). NMR spectra are recorded with tetramethylsilane as the internal standard. 1H NMR spectra are recorded at 300 MHz, and 13C NMR spectra were recorded at 75 MHz (Bruker Avance). 1H NMR chemical shifts (δ) were reported in ppm relative to tetramethylsilane (TMS) with the solvent signal as the internal standard (CDCl3 at 7.26 ppm, (CD3)2SO at 2.50 ppm). 13C NMR chemical shifts are reported in ppm from tetramethylsilane (TMS) with the solvent resonance as the internal standard (CDCl3 at 77.00 ppm, (CD3)2SO at 39.52 ppm). Data are given as: s (singlet), d (doublet), t (triplet), q (quartet), dd (double of doublet) or m (multiplets), coupling constants (Hz) and integration. Flash column chromatography was carried out using silica gel eluting with ethyl acetate and petroleum ether. High resolution mass spectra were obtained with the Q-TOF-Premier mass spectrometer. Reactions were monitored by TLC and visualized with ultraviolet light. Enantioemic excess was determined by HPLC analysis on chiralpak AD-H, or IC columns. Optical rotations are reported as follows: [α] D 25 °C in g/100 mL, CHCl3.

(3R, 4R, 5S)-1'-octyl-spiro[4,3''][oxindole-spiro[5,3''][1''-octyl-oxindole-tetrahydrothiophen-3-ol (3g)]
White solid, mp: 169-170 °C; 91% yield, [α]D25 = +62.8 (c=0.42, CHCl3); (dr=96:4, 87% ee for the major diastereomer). HPLC Conditions: ee was determined by HPLC analysis (Chiralcel AD-H, Hexane/i-PrOH = 80/20, 1.0mL/min, 254 nm.) Retention time: tminor=6.41 min, tmajor=12.34 min; 1H NMR (300 MHz, CDCl3) δ (ppm): 7.53 (d, J=8 Hz, 1H), 7.48 (d, J=8 Hz, 1H), 7.10-7.18 (m, 2H), 6.90 (t, J=8 Hz, 2H), 6.61 (d, J=8 Hz, 1H), 6.57 (d, J=8 Hz, 1H), 5.73-5.81 (m, 1H), 3.95 (t, J=6 Hz, 1H), 3.49-3.71 (m, 3H), 3.41-3.49 (m, 2H), 2.21 (d, J=7 Hz, 1H), 1.49-1.50 (m, 4H), 1.24-1.25 (m, 20H), 0.87 (t, J=6 Hz, 6H); 13C NMR (75 MHz, CDCl3) δ (ppm): 177.6, 172.6, 144.3, 142.9, 129.6, 129.2, 126.4, 125.3, 125.0, 124.2, 122.6, 122.2, 108.2, 77.3, 64.0, 59.7, 40.4, 40.0, 34.1, 31.7, 29.2, 29.1, 29.0, 27.4, 27.3, 26.9, 26.9, 22.6, 14.0. HRMS-ESI (m/z): Calcd. for C13H24N2O3S, [M+H]+: 563.33019, Found: 563.32868.

(3R, 4R, 5S)-1'-octyl-spiro[4,3''][oxindole-spiro[5,3''][1''-octyl-oxindole-tetrahydrothiophen-3-ol (3ent-3g)]
White solid, mp: 167-169 °C; 80% yield, [α]D25 = -154.3 (c=0.65, CHCl3); (dr=93:7, 88% ee for the major diastereomer). HPLC Conditions: ee was determined by HPLC analysis (Chiralcel AD-H, Hexane/i-PrOH = 80/20, 1.0mL/min, 254 nm.) Retention time: tmajor=6.47 min, tminor=12.69 min.

(3R, 4R, 5S)-1'-benzyl-spiro[4,3''][oxindole-spiro[5,3''][1''-benzyl-oxindole-tetrahydrothiophen-3-ol (3h)]
White solid, mp: 174-175 °C; 85% yield, [α]D25 = +112.7 (c=0.61, CHCl3); (dr=84:16, 99% ee for the major diastereomer). HPLC Conditions: ee was determined by HPLC analysis (Chiralcel AD-H, Hexane/i-PrOH = 50/50, 0.6mL/min, 254 nm.) Retention time: tminor=15.44 min, tmajor=56.70 min; 1H NMR (300 MHz, CDCl3) δ (ppm): 7.47-7.48 (m, 2H), 7.20-7.22 (m, 6H), 7.00-7.09 (m, 6H), 6.81-6.82 (m, 2H), 6.50-6.51 (m, 2H), 5.86-5.87 (m, 1H), 4.87-4.99 (m, 3H), 4.71-4.88 (m, 1H), 4.04 (d, J=8 Hz, 1H), 3.61 (t, J=8 Hz, 1H), 2.31 (d, J=8 Hz, 1H); 13C NMR (75 MHz, CDCl3) δ (ppm): 178.0, 172.9, 144.0, 142.6, 135.1, 134.9, 129.6, 129.3, 128.7, 128.6, 127.5, 127.4, 127.1, 127.0, 126.6, 125.3, 124.2, 123.3, 122.8, 109.2, 109.1, 77.7, 64.3, 59.9, 44.1, 43.6, 34.1. HRMS-ESI (m/z): Calcd. for C25H24N2O3S2[M+H]+: 578.99471, Found: 578.99355.

(3R, 4R, 5S)-1'-propyl-6'-bromo-spiro[4,3''][oxindole-spiro[5,3''][1''-propyl-6''-bromo-oxindole-tetrahydrothiophen-3-ol (3k)]
White solid, mp: 180-181 °C; 77% yield, [α]D25 = +51.8 (c=0.50, CHCl3); (dr=85:15, 75% ee for the major diastereomer). HPLC Conditions: ee was determined by HPLC analysis (Chiralcel AD-H, Hexane/i-PrOH = 80/20, 1.0mL/min, 254 nm.) Retention time: tminor=7.50 min, tmajor=8.64 min; 1H NMR (300 MHz, CDCl3) δ (ppm) 7.37 (d, J=8 Hz, 1H), 7.30 (d, J=8 Hz, 1H), 7.04 (dd, J=8 Hz, J=1 Hz, 1H), 6.78 (d, J=1 Hz, 1H), 6.73 (d, J=1 Hz, 1H), 5.68-5.72 (m, 1H), 3.93 (t, J=9 Hz, 1H), 3.44-3.62 (m, 5H), 2.01-2.02 (m, 1H), 1.51-1.60 (m, 4H), 0.88 (t, J=7 Hz, 6H); 13C NMR (75 MHz, CDCl3) δ (ppm): 177.4, 172.4, 145.7, 144.2, 127.6, 126.3, 125.7, 125.2, 124.0, 123.7, 123.4, 122.9, 111.8, 63.7, 59.8, 42.1, 41.7, 34.0, 29.6, 20.6.
(3R, 4R, 5S)-1'-propyl-7'-fluoro-spiro[4.3']oxindole-spiro[5.3'][1']-propyl-7'-fluoro-oxindole-tetrahydrothiophen-3-ol (3i)

White solid, mp: 165-167 °C; 79% yield, \([\alpha]_D^{25}=-139.4\) (c=0.60, CHCl₃); (dr=62:38, 98% ee for the major diastereomer). HPLC Conditions: ee was determined by HPLC analysis (Chiralcel AD-H, Hexane/i-PrOH = 80/20, 1.0mL/min, 254 nm.) Retention time: \(t_{\text{major}}=11.44\) min, \(t_{\text{minor}}=23.25\) min; \(^1\)H NMR (300 MHz, DMSO) \(\delta\) (ppm): 7.03-7.04 (m, 1H), 6.93-6.94 (m, 1H), 6.72-6.73 (m, 4H), 5.60-5.62 (m, 1H), 5.46-5.49 (m, 1H), 3.77-3.78 (m, 1H), 3.63 (s, 6H), 3.54-3.61 (m, 2H), 3.43-3.44 (m, 2H), 3.23-3.24 (m, 1H), 1.40-1.48 (m, 4H), 0.70 (t, \(J=7\) Hz, 6H); \(^1^C\) NMR (75 MHz, DMSO) \(\delta\) (ppm): 176.5, 171.8, 155.2, 154.7, 133.6, 133.0, 126.5, 125.7, 114.0, 113.0, 112.6, 112.5, 109.2, 108.5, 76.2, 63.5, 58.9, 55.4, 55.3, 41.1, 40.6, 33.6, 20.4, 20.3, 11.1, 11.0. HRMS-ESI (m/z): Calcd. for C₂₃H₂₅F₂N₂O₅S, [M+H]⁺: 483.19471, Found: 483.19355.

(3R, 4R, 5S)-1'-propyl-5'-chloro-spiro[4.3']oxindole-spiro[5.3'][1']-propyl-5'-chloro-oxindole-tetrahydrothiophen-3-ol (3o)

White solid, mp: 171-172 °C; 76% yield, \([\alpha]_D^{25}=-99.4\) (c=0.66, CHCl₃); (dr=83:17, 69% ee for the major diastereomer). HPLC Conditions: ee was determined by HPLC analysis (Chiralcel OD-H, Hexane/i-PrOH = 80/20, 1.0mL/min, 254 nm.) Retention time: \(t_{\text{major}}=10.25\) min, \(t_{\text{minor}}=23.88\) min; \(^1^H\) NMR (300 MHz, DMSO) \(\delta\) (ppm): 7.37-7.38 (m, 1H), 7.26-7.29 (m, 3H), 6.92-6.95 (m, 2H), 5.82-5.84 (m, 1H), 5.47-5.49 (m, 1H), 3.80-3.84 (m, 1H), 3.70-3.77 (m, 2H), 3.40-3.44 (m, 2H), 3.31-3.34 (m, 1H), 1.44-1.19 (m, 4H), 0.70 (t, \(J=7\) Hz, 6H); \(^1^C\) NMR (75 MHz, DMSO) \(\delta\) (ppm): 176.4, 171.7, 143.3, 141.8, 129.7, 129.0, 127.0, 126.7, 126.0, 125.8, 124.7, 110.6, 110.0, 76.2, 63.3, 58.2, 41.4, 40.8, 33.4, 20.5, 20.4, 10.9, 10.8. HRMS-ESI (m/z): Calcd. for C₂₃H₂₅Cl₂N₂O₅S, [M+H]⁺: 491.09575, Found: 491.09677.

(3S, 4S, 5R)-1'-propyl-5'-methoxy-spiro[4.3']oxindole-spiro[5.3'][1']-propyl-5'-methoxy-oxindole-tetrahydrothiophen-3-ol (3n)

White solid, mp: 165-167 °C; 82% yield, \([\alpha]_D^{25}=-79.9\) (c=0.36, CHCl₃); (dr=20:1, 82% ee). HPLC Conditions: ee was determined by HPLC analysis (Chiralcel OD-H, Hexane/i-PrOH = 80/20, 1.0mL/min, 254 nm.) Retention time: \(t_{\text{major}}=11.17\) min, \(t_{\text{minor}}=22.32\) min; \(^1^H\) NMR (300 MHz, DMSO) \(\delta\) (ppm): 7.37-7.38 (m, 1H), 7.26-7.29 (m, 3H), 6.92-6.95 (m, 2H), 5.82-5.84 (m, 1H), 5.47-5.49 (m, 1H), 3.80-3.84 (m, 1H), 3.70-3.77 (m, 2H), 3.40-3.44 (m, 2H), 3.31-3.34 (m, 1H), 1.44-1.19 (m, 4H), 0.70 (t, \(J=7\) Hz, 6H); \(^1^C\) NMR (75 MHz, DMSO) \(\delta\) (ppm): 176.4, 171.7, 143.3, 141.8, 129.7, 129.0, 127.0, 126.7, 126.0, 125.8, 124.7, 110.6, 110.0, 76.2, 63.3, 58.2, 41.4, 40.8, 33.4, 20.5, 20.4, 10.9, 10.8. HRMS-ESI (m/z): Calcd. for C₂₃H₂₅Cl₂N₂O₅S, [M+H]⁺: 491.09575, Found: 491.09677.
ESI (m/z): Calcd. for C_{173}H_{172}O_{144}N_{143}O_{130}S_{129} [M+H]^+ = 595.32002, Found: 595.3189.
