DOI: 10.1039/b000000x

Hexahydrobenzo[de]isochromanes and hexahydropyrano[3,4,5-ij]isoquinolines can be efficiently synthesized *via* Friedel Crafts and oxa Pictet-Spengler reaction of acrylyl enol ethers mediated by triflic acid in good yields. The reaction is highly stereoselective. Two of the hexahydrobenzo[de]isochromanes are found to have moderate antileishmanial activity.

## Introduction

Heterocyclic structures are considered as prominent features in synthetic chemistry because of their existence in many natural products and biologically active molecules. Particularly, oxygen heterocyclic compounds fused with aromatic ring systems such as chromane<sup>1</sup> and isochromane<sup>2</sup> derivatives are reported to be biologically active. As for example excentricine, *N*-methyl excentricine isolated from *Stephania excentrica* and stephalooxocanine isolated from *Stephania cepharantha* are acetylcholinesterase inhibitors.<sup>3</sup> Owing to their wide range of biological activities, synthesis of substituted isochromans have attracted the attention of the synthetic community and various methods have been developed for the functionalization of isochromane core in recent years.<sup>4</sup> Therefore, development of suitable methodology for the synthesis of substituted isochromans, in a single step, is most desirable. Friedel crafts<sup>5</sup> and Pictet-Spengler<sup>6</sup> reactions are two important C-C bond forming reactions and are demonstrated in the synthesis of structurally diverse molecules. Herein, we wish to disclose a methodology for the synthesis of hexahydrobenzo[de]isochromane from aryl and alkene substituted acrylyl enol ethers catalyzed by triflic acid. We

**Fig. 1** Biologically important hexahydropyrano[3,4,5-ij]isoquinoline derivatives

envisioned that treatment of enol ether **1** with triflic acid would provide carbocation **A**, which after Friedel Crafts reaction will give enol ether **B**. The enol ether **B** will generate oxonium ion under acidic condition to facilitate the oxa Pictet-Spengler type reaction to give the tricyclic compound **2** (Scheme 1).

**Scheme 1.** Strategy for isochromane synthesis

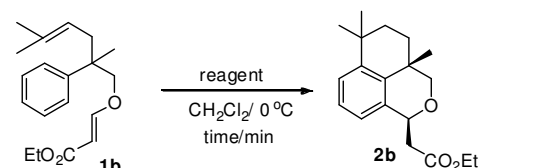

## Results and discussion

The reaction of (*E*)-ethyl 3-((5-methyl-2-phenylhex-4-en-1-yl)oxy)acrylate **1b** with triflic acid gave ethyl 2-((1*S*\*,3*aS*\*)-3*a*,6,6-trimethyl-1,3,3*a*,4,5,6-hexahydrobenzo[de]isochroman-1-yl)acetate **2b** in 75% yield. The reaction was also performed with different Bronsted and Lewis acids and the results are shown in Table 1. The reaction with 1.0 equivalent of BF<sub>3</sub>·OEt<sub>2</sub>, In(OTf)<sub>3</sub>, Sc(OTf)<sub>2</sub>, and InCl<sub>3</sub> produced no products, but starting material

1 recovered in all the cases. On the other hand, TMSOTf, FeCl<sub>3</sub> and  
 2 TsOH gave inseparable mixture of products (Table 1). The scope  
 3 of the reaction is investigated by employing different types of  
 4 substrates having aliphatic and aromatic substituents at different  
 5 positions of the acrylyl enol ethers. It was observed from the  
 6 Table 1 that, substrates having electron donating groups on the  
 7 aromatic ring gave products in good yield. The reaction is highly  
 8 diastereoselective and produced exclusively single diastereomers  
 9 in most of the cases, and the stereochemistry of compounds is  
 10 determined by 2-D nuclear Overhauser effect (NOESY). The  
 11 products **2a**, **2h-j**, and **2m** where there is no bridgehead methyl  
 12 group, the hydrogen at 3Ca-H and hydrogen at C1-H are in *cis*  
 13 configuration, which is determined from the DEPT, HMQC and  
 14 NOESY experiments of **2i**. It showed a clear characteristic NOE

9	TfOH (10 mol%)	10	75 <sup>33</sup>

<sup>a</sup>Reaction conditions: enol ether (1.0 mmol), solvent (2 mL) <sup>b</sup>Yield refers to isolated yield. <sup>c</sup>No reaction, starting material was recovered. <sup>d</sup>complex mixture.

34 correlation between the hydrogens 3Ca-H and C1-H (see SI).  
 35 Similarly, compounds **2b**, **2k** and **2o** having bridgehead  
 36 substituents show *cis* relationship between the substituents at C-1

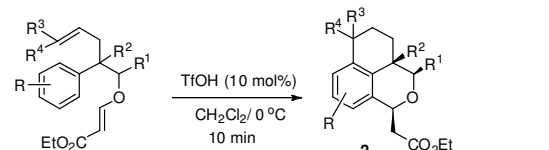

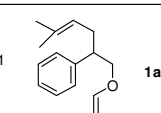

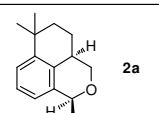

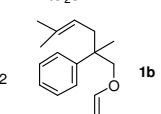

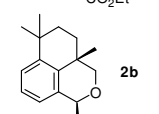

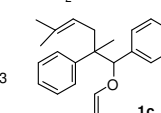

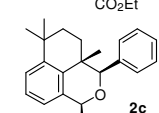

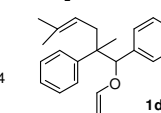

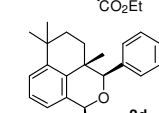

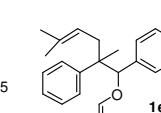

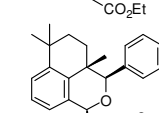

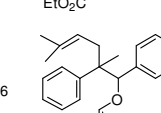

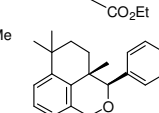

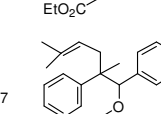

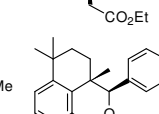

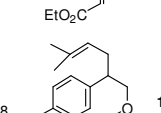

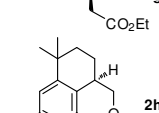

52 **Figure 2.** NOE of compounds **2b**, **2d**, **2i** and **2q**

53 and C-3a positions. It was confirmed by NOE experiment of the  
 54 compound **2b**. On the other hand, stereochemistry of the products  
 55 having substitutions at 1, 3, 3a and 6 positions is determined by  
 56 NOE experiments of **2d**. In case of mono substitution at 6-  
 57 position of the products, diastereomeric mixture with different  
 58 ratios were obtained (entries 11-13, 15). The reaction is mild and  
 59 substituents such as ester, ether, and halides are not affected in  
 60 these reaction conditions.

61 After successful study of this methodology to the synthesis of  
 62 hexahydrobenzo[de]isochromane, its application to the synthesis  
 63 of hexahydropyrano[3,4,5-*ij*]isoquinoline was explored. The  
 64 starting material enol ethers **1p-q** (Scheme 2) when treated with

25 triflic acid under the same reaction conditions gave ethyl 2-  
 26 ((7*R*\*,9*aS*\*)-3,3-dimethyl-1-tosyl-1,2,3,7,9,9*a* hexahydro-  
 27 pyrano[3,4,5-*ij*]isoquinolin-7-yl)acetate **2p** and ethyl-  
 28 ((3*S*\*,7*R*,9*aS*\*)-3-methyl-3-phenyl-1-tosyl-1,2,3,7,9,9*a*-  
 29 hexahydropyrano[3,4,5-*ij*]isoquinolin-7-yl)acetate **2q** in 90%  
 30 and 85% yields, respectively (Scheme 2). The stereochemistry of  
 31 **2p** and **2q** is determined by NOE experiment of **2q** (see SI).

32 **Scheme 2.** Synthesis of hexahydropyrano[3,4,5-*ij*]isoquinoline

47

48 The mechanism of formation of hexahydrobenzo[*de*]isochromans  
 49 can be explained as follows. The enol ether **1** reacts with acid to  
 50 form carbocation **A**, which after Friedel-Crafts reaction and  
 51 subsequent elimination and addition of protons give  
 52 oxocarbenium ion **C**. The oxocarbenium ion **C** is then attacked  
 53 by aromatic ring *via* Pictet-Spengler type reaction to form  
 54 hexahydrobenzo[*de*]isochromane **2** (Scheme 3).

55 **Scheme 3** Plausible mechanism of the reaction

65

66 **Evaluation of antileishmanial activity of 2f, 2j and 2p**

67

68 Leishmania is a dimorphic protozoan parasite, which is  
 69 responsible for self healing cutaneous leishmaniasis (CL) and life  
 70 claiming visceral leishmaniasis (VL), commonly known as kala-

1 azar in India.<sup>7</sup> Due to the high toxicity, high cost and drug  
 2 resistance of available drugs, there is a need of synthesizing and  
 3 evaluation of antileishmanial activity of new compounds.<sup>8</sup> We  
 4 have already studied the antileishmanial activity of few  
 5 oxabicyclo[3.3.1]nonanones and found promising result for one  
 6 of the compounds.<sup>9</sup> Encouraged by these results we have  
 7 undertaken to screen some tricyclic oxygen and nitrogen  
 8 heterocycles fused with aromatic ring as these ring systems such  
 9 as chromane<sup>1</sup> and isochromane<sup>2</sup> derivatives are reported to be  
 10 biologically active. The three compounds were experimentally  
 11 assessed for their anti-leishmanial activities. IC<sub>50</sub> values for **2f**,  
 12 **2j** and **2p** were found out to be 72.5 μM, 98.75 μM and 440 μM  
 13 respectively. The compounds **2f** and **2h** were found to be most  
 14 effective against *Leishmania donovani* promastigotes with  
 15 moderate IC<sub>50</sub> values, while compound **2p** was found to be least  
 16 effective with a high IC<sub>50</sub> value (**Figure 3**). This signifies that  
 17 *Leishmania donovani* promastigotes are more sensitive to  
 18 compounds **2f** and **2h** as compared to **2p**. However, the known  
 19 potential antileishmanials like miltefosine has an IC<sub>50</sub> value of  
 20 25 μM. Thus there is need for further improvement in the efficacy  
 21 of these compounds. This provides a novel chemical space for  
 22 further modification for development of highly effective  
 23 antileishmanial compounds.

## 24 Conclusions

25 In conclusion, we have developed a mild and efficient method for  
 26 the synthesis of hexahydrobenzo[de]isochromane *via* Friedel  
 27 Crafts and oxa Pictet-Spengler type reaction of enol ether in good  
 28 yields. The same methodology can be used for the synthesis of  
 29 hexahydropyrano[3,4,5-ij]isoquinoline. The reaction is highly  
 30 diastereoselective and compatible to functional groups such as  
 31 ester, halides and ether. This methodology would provide a tool  
 32 to synthesize tricyclic heterocyclic compounds having a  
 33 functional group at the bridgehead position. Two of the  
 34 hexahydrobenzo[de]isochromanes **2f**, **2h** are found to have  
 35 antileishmanial activity with IC<sub>50</sub> values 72.5 μM and 98.75 μM,  
 36 respectively.

## 37 Experimental section

38 **General Information:** General Information: All the reagents  
 39 were of reagent grade (AR grade) and were used as purchased  
 40 without further purification. Silica gel (60-120 mesh size) was  
 41 used for column chromatography. Reactions were monitored by  
 42 TLC on silica gel GF254 (0.25 mm). Melting points were  
 43 recorded in an open capillary tube and are uncorrected. Fourier  
 44 transform-infra red (FT-IR) spectra were recorded as neat liquid  
 45 or KBr pellets. NMR spectra were recorded in CDCl<sub>3</sub> with  
 46 tetramethylsilane as the internal standard for <sup>1</sup>H (600 MHz, 400  
 47 MHz) or <sup>13</sup>C (150 MHz, 100 MHz) NMR. Chemical shifts (δ) are  
 48 reported in ppm and spin-spin coupling constants (J) are given in  
 49 Hz. HRMS spectra were recorded using Q-TOF mass  
 50 spectrometer. The starting material enol ethers **1a-q** is prepared  
 51 as per literature procedure (see SI).

26  
 27 **General Procedure for the Synthesis of cyclized product 2a-q:**

28  
 29 To a solution of enol ether (1.0 mmol) in dry dichloromethane (1  
 30 mL) at 0  $^\circ\text{C}$  was added trifluoromethanesulfonic acid (10 mol%)  
 31 under a  $\text{N}_2$  atmosphere. The reaction mixture was stirred for 10  
 32 minutes. The progress of the reaction was monitored by TLC  
 33 with ethyl acetate and hexane (EtOAc/hexane 24:1) as eluents.  
 34 After the completion of the reaction, the solvent was removed on  
 35 a rotary evaporator and quenched with a saturated solution of  
 36  $\text{NaHCO}_3$  (2 mL). The product was extracted with ethyl acetate  
 37 (10 mL) and then washed with brine solution (3 mL). The organic  
 38 layer was dried ( $\text{Na}_2\text{SO}_4$ ) and evaporated to give the crude  
 39 product, which was purified by column chromatography over  
 40 silica gel giving corresponding products 2a-q.

## 12 Antileishmanial activity assay

14 *Leishmania donovani* (MHOM/IN/2010/BHU 1081) strain was  
15 obtained from Dr. Shyam Sundar, Banaras Hindu University,  
16 Varanasi and cultivated in M199 liquid media supplemented with  
17 15% heat-inactivated fetal bovine serum (FBS), 100 U penicillin  
18 and 100  $\mu\text{g ml}^{-1}$  streptomycin was used for assessing the anti-  
19 leishmanial activity of **2f**, **2j** and **2p**. The anti-leishmanial effect  
20 was checked using methods reported earlier.<sup>9a,10,11</sup> MTT [3-(4,5-  
21 dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide] assay  
22 was employed to check the antileishmanial efficacy of the  
23 compounds. Exponential phase promastigote cells ( $2.5 \times 10^6$ )  
24 were seeded in a 96 well plate and treated with varying  
25 concentrations of compounds and incubated at 25°C for 24 hours.  
26 Cells were centrifuged and resuspended in MTT (0.5mg/ml) and  
27 again incubated at 25°C for 4 hours. Cells were again centrifuged  
28 and DMSO was added to dissolve the formazon pellet and  
29 absorbance taken at 570 nm. Miltefosine ( $\text{IC}_{50}$ -25  $\mu\text{M}$ ), a potent  
30 antileishmanial compound was used as a positive control.

## 33 Acknowledgements

35 Authors are grateful to Council of Scientific and Industrial  
36 Research (CSIR), New Delhi, (Grant No. 02/0159/13/EMR-II)  
37 and Centre of Excellence (CoE), MHRD, New Delhi, for  
38 financial support. Authors are also thankful to Central Instrument  
39 Facility (CIF) of IIT Guwahati for NMR and HRMS facilities. SS  
40 and NRD are grateful to MHRD, New Delhi for their fellowship,  
41 respectively.
