This is an Accepted Manuscript, which has been through the Royal Society of Chemistry peer review process and has been accepted for publication.

Accepted Manuscripts are published online shortly after acceptance, before technical editing, formatting and proof reading. Using this free service, authors can make their results available to the community, in citable form, before we publish the edited article. This Accepted Manuscript will be replaced by the edited, formatted and paginated article as soon as this is available.

You can find more information about Accepted Manuscripts in the Information for Authors.

Please note that technical editing may introduce minor changes to the text and/or graphics, which may alter content. The journal's standard Terms \& Conditions and the Ethical guidelines still apply. In no event shall the Royal Society of Chemistry be held responsible for any errors or omissions in this Accepted Manuscript or any consequences arising from the use of any information it contains.

# Unsymmetrical squaraines with new linked manner for high-performance solution-processed small-molecule organic photovoltaic cells $\dagger$ 

Lin Yang, $\ddagger^{\mathrm{a}}$ Daobin Yang, $\star^{\mathrm{a}, \mathrm{b}}$ Yao Chen, ${ }^{\text {a }}$ Qian Luo, ${ }^{\text {a }}$ Mangang Zhang, ${ }^{\text {a }}$ Yan Huang, * $^{\text {a }}$ Zhiyun Lu,*a Hisahiro Sasabe, ${ }^{*}{ }^{\mathrm{b}}$ and Junji Kido ${ }^{\text {b }}$

#### Abstract

Squaraines have been promising donor materials because of their strong and broad absorption band in the visible and near infrared regions which is suitable for application in organic photovoltaic (OPV) cells. Two unsymmetrical squaraines (USQs), namely BIBISQ and TIBISQ, with two electron-donating aryls directly linked to the electron-withdrawing squaric acid core (Y-manner) could act as high performance donor materials for solution-processed bulk-heterojunction OPV cells. Both of two USQs show ideal low bandgaps (1.47 eV for BIBISQ and 1.39 eV for TIBISQ) with an intense and broad absorption band in the range of $500-900 \mathrm{~nm}$, and relatively low HOMO levels of $\sim-5.10 \mathrm{eV}$. The BHJ-OPV based on both of them simultaneously show excellent $J_{s c}$ (over $13 \mathrm{~mA} \mathrm{~cm}^{-2}$ ), $V_{o c}(0.84 \mathrm{~V}), \mathrm{FF}(0.49)$ and PCEs of over $5 \%$ under the blend ratio of USQs: $\mathrm{PC}_{71} \mathrm{BM}=1: 3$. These results are indicating that the two USQs are quite promising candidates for small molecular (SM) OPV and the Y-manner should be quite perspective linked method for USQs.

Keywords squaraine, organic photovoltaic cell, linked manner, increased donor content

## 1. Introduction

Owing to its nanometer-scaled phase separation in the donor-acceptor (D-A) blending system thus more efficient D/A interfacial contact, bulk-heterojunction (BHJ) organic photovoltaic (OPV) device has been considered as a promising technique for renewable energy source applications. ${ }^{1,2}$ In recent decade, small molecular (SM) photovoltaic donor materials have attracted considerable attention for preparing BHJ-OPVs due to their unique advantages over their polymer counterparts, such as well-defined molecular structure and molecular weight, facile synthesis and high purity without batch to batch variations. ${ }^{3}$ Therefore, many kinds of small molecular photovoltaic donor materials have been developed, including oligothiophenes, dyes, fused acenes, triphenylamine-based molecules and so on. ${ }^{4-8}$ Up to now, the power conversion efficiency (PCE) of SMOPVs have been achieved as high as $>10 \%$ with a high donor content ( $\mathrm{D}: \mathrm{A}=1: 0.8$ ) when employed an oligothiophene derivative (DRCN5T) as donor material. ${ }^{9}$

Recently, squaraines (SQs) have emerged as promising donor materials in OPVs due to their strong and broad absorption band in the visible and near infrared regions. ${ }^{10-16}$ As far, the record power conversion efficiency (PCE) of squaraines based BHJ-OPVs is $5.50 \%$ with a rather low donor content (D/A ratio is $1: 6)^{17}$ and the PCE of tandem devices based on squaraines is up to $8.3 \% .^{18}$

In recent years, our group has designed a series of USQs in which the D and D' segments are connected to the A subunit directly and via a methylidene bridge, respectively (X-manner in Scheme 1), and the PCE of these USQs based BHJ-OPV
devices is improved from $1.54 \%$ to $4.29 \%$, however, the optimized D/A ratios fall into the region of 1:8~1:5 with a low donor content. ${ }^{19-22}$ According to the literature reported, the photophysical and chemical properties of squaraines are correlated highly with their connected manners, ${ }^{23,24}$ which are closely related with their OPV performance. Therefore, very recently, our group has firstly designed some USQs with their two electron-donating aryls linked directly to the electron-withdrawing squaric acid core in Y-manner (Scheme 1). ${ }^{25}$ The OPV device based on them rendered a short current density $\left(J_{s c}\right)$ of up to $12.03 \mathrm{~mA} \mathrm{~cm}^{-2}$ and a PCE of $4.35 \%$ with a D/A ratio of 1:5. These preliminary results indicated that D and D ' linked to A in Y -manner should be quite promising linked manner for USQs donor materials. However, the PCE of them is unsatisfactory due to their relatively low open circuit voltage ( $V_{o c}$, 0.78 V ) and fill factor (FF, 0.45). It is noteworthy that one of their donor segments is pyrrole derivative, whose electron-donating ability is much better than phenyl groups, which leads to a relatively high HOMO energy level and then low $V_{o c}$.

Scheme 1. Two linking manners of photovoltaic USQs derivatives.

Therefore, from these previous results, two novel USQs with Y-manner linked have been designed and synthesized. The phenyl groups, such as $N, N$-dibutylaniline ${ }^{16,26}$ or 4-(p-tolyl)-1,2,3,3a,4,8b-hexahydrocyclopenta[b]indole which are the promising groups in OPV donor materials were used to be D subunit; ${ }^{20,}{ }^{27}$ 5-(8,9,10,10a-tetrahydrobenzo[e]cyclopenta[b]indol-7(7aH)-yl)benzene-1,3-diol, was
chosen to act as D＇subunit．${ }^{25}$ The molecular structures of two novel USQs（BIBISQ and TIBISQ）are shown in Scheme 2．Both of two USQs show ideal low bandgaps of 1.47 eV for BIBISQ and 1.39 eV for TIBISQ with an intense and broad absorption band in the range of $500-900 \mathrm{~nm},{ }^{28}$ and relatively low HOMO levels of $\sim-5.10 \mathrm{eV}$ ． The BHJ－SMOPV based on both of them simultaneously show enhanced $V_{o c}(0.84 \mathrm{~V})$ and FF（0．49）．Meanwhile，the excellent $J_{s c}$ of over $13 \mathrm{~mA} \mathrm{~cm}^{-2}$ is achieved due to the relatively high content of USQs（USQs： $\mathrm{PC}_{71} \mathrm{BM}=1: 3$ ）．Ultimately，the PCEs of BHJ－SMOPV based on USQs are over 5\％．Especially，the BHJ－SMOPV based on the TIBISQ shows a high $J_{\mathrm{sc}}$ of up to $13.50 \mathrm{~mA} \mathrm{~cm}^{-2}$ and an excellent PCE of $5.49 \%$ ， which could compare to the highest $J_{\mathrm{sc}}{ }^{29}$ and $\operatorname{PCE}{ }^{17,30,31}$ among all the reported squaraine based BHJ－OPV cells．These results indicate that Y－manner is indeed a quite promising linking way for the construction of high performance OPV USQs．

## 2．Materials and methods

## 2．1．Instruments and characterization

${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Bruker Avance AV II－ 400 MHz instrument with tetramethylsilane as internal standard．High resolution mass spectra were measured on a Shimadzu LCMS－IT－TOF．The purity of the two USQs were measured by EZChrom Elite for Hitachi high performance liquid chromatography （DAD and RI detector）．Absorption spectra of two USQs in $5 \times 10^{-6} \mathrm{~mol} \mathrm{~L}^{-1}$ chloroform solution and thin film states were measured with a Perkin Elmer Lamdba 950 UV－Vis scanning spectrophotometer．

### 2.2. Electrochemistry measurement

Cyclic voltammetry was performed in $0.10 \mathrm{~mol} \mathrm{~L}^{-1}$ tetrabutylammonium perchlorate/anhydrous dichloromethane $\left(2.5 \times 10^{-4} \mathrm{~mol} \mathrm{~L}^{-1}\right)$ with a LK 2010 electrochemical work station, using a three-electrode cell with a Pt disk working electrode, a Pt wire counter electrode and a $\mathrm{Ag} / \mathrm{AgNO}_{3}(0.1 \mathrm{~mol} \mathrm{~L}$ in acetonitrile) reference electrode. Solutions have been pre-degassed by argon bubbling for 30 min prior to each experiment. At the end of each measurement, ferrocenium/ferrocene redox couple was added as an internal potential reference.

### 2.3. Preparation of organic photovoltaic cells

Photovoltaic devices were fabricated on indium-tin oxide (ITO) coated-glass substrate $\left(\right.$ sheet resistance $\left.=15 \Omega \mathrm{sq}^{-1}\right)$ with a layered structure of $\mathrm{ITO} / \mathrm{MoO}_{3}(8 \mathrm{~nm}) /$ USQs: $\mathrm{PC}_{71} \mathrm{BM}(60 \mathrm{~nm}) / \mathrm{BCP}(6 \mathrm{~nm}) / \mathrm{Al}(100 \mathrm{~nm})$. The patterned ITO-coated glass substrates were cleaned through sequential sonication in detergent, deionized water, acetone and isopropanol for 20 min each. The cleaned substrates were dried in an oven at $65{ }^{\circ} \mathrm{C}$ for 12 h before using. The substrate was treated by UV-ozone for 30 min, then immediately transferred into a high vacuum chamber for deposition of 8 nm $\mathrm{MoO}_{3}$ at pressure of less than $1 \times 10^{-4} \mathrm{~Pa}$ with a rate of $0.2 \AA \AA^{-1}$. Subsequently, the photoactive layer (thickness: $60 \pm 5 \mathrm{~nm}$ ) was fabricated by spin-casting a blend of the USQs and $\mathrm{PC}_{71} \mathrm{BM}$ in chloroform solution with total concentration of $20 \mathrm{mg} \mathrm{mL}^{-1}$ ( $3500 \mathrm{rpm}, 45 \mathrm{~s}$ ) under a $\mathrm{N}_{2}$-filling glove box at $25^{\circ} \mathrm{C}$. Finally, the substrates were transferred back to the high-vacuum chamber, where BCP ( 6 nm ) and Al ( 100 nm ) were deposited as the top electrode at pressures of less than $2 \times 10^{-4} \mathrm{~Pa}$ with a rate of
$0.20 \AA^{-1}$ and $2.0 \sim 3.0 \AA^{-1}$, respectively. The active area of OPV cells is $9 \mathrm{~mm}^{2}$. To obtain the average data related to device performance, several batches of devices (4 cells per batch) for each set of conditions were fabricated and tested. Current density-voltage ( $J-V$ ) and external quantum efficiency (EQE) characterization of organic photovoltaic cells were performed on a CEP-2000 integrated system manufactured by Bunkoukeiki Co. The integration of EQE data over a AM 1.5 G solar spectrum yielded calculated $J_{s c}$ values with an experimental variation of less than $5 \%$ was relative to the $J_{s c}$ measured under $100 \mathrm{~mW} \mathrm{~cm}^{-2}$ simulated AM 1.5 G light illumination. Hole-only devices were fabricated with the structures of ITO/ $\mathrm{MoO}_{3}$ (8 $\mathrm{nm}) /$ USQs: $\mathrm{PC}_{71} \mathrm{BM}(60 \mathrm{~nm}) / \mathrm{MoO}_{3}(8 \mathrm{~nm}) / \mathrm{Al}(100 \mathrm{~nm})$.

Samples for atomic force microscopy (AFM) measurements were prepared by spin-casting from USQs: $\mathrm{PC}_{71} \mathrm{BM}=1: 3$ in chloroform solution on glass substrates.

### 2.4. Synthesis

The synthetic routes of intermediates and target molecules USQs are outlined in Scheme 2. Compounds 1-9 were prepared according to the procedures described in the literatures. ${ }^{25,27,32,33} n$-Butanol and toluene were distilled from sodium freshly prior to use. All the other chemicals, reagents, and solvents were used as received from the suppliers.

### 2.4.1 N,N-dibutylaniline (1)

A mixture of aniline ( $5 \mathrm{~mL}, 52.63 \mathrm{mmol}$ ), $n-\mathrm{C}_{4} \mathrm{H}_{8} \mathrm{Br}(17 \mathrm{~mL}, 157.89 \mathrm{mmol})$ and $\mathrm{Na}_{2} \mathrm{CO}_{3}(22.37 \mathrm{~g}, 210.53 \mathrm{mmol})$ in 25 mL of $9: 1 \mathrm{v} / \mathrm{v}$ dimethylformamide (DMF)/ $N$-methylpyrrolidinone (NMP) was heated at $120{ }^{\circ} \mathrm{C}$ for 12 h . The reaction
mixture was then cooled to room temperature and filtered to remove the insoluble material. The precipitate was washed with ethyl acetate, and the combined filtrate was evaporated to dryness. Water was the added, and the aqueous phase was extracted with ethyl acetate. After silica gel column chromatography (hexane), a pale yellow oil ( $9.18 \mathrm{~g}, 85 \%$ ) was obtained.

### 2.4.2 4-(p-Tolyl)-1,2,3,3a,4,8b-hexahydrocyclopenta[b]indole (3)

A mixture of compound $2(0.80 \mathrm{~g}, 5.02 \mathrm{mmol})$, 1-bromo-4-methylbenzene ( 0.86 g , 5.02 mmol ), NaOBu- $t$ [sodium tert-butoxide] ( $0.72 \mathrm{~g}, 7.53 \mathrm{mmol}$ ), $\mathrm{Pd}(\mathrm{OAc})_{2}$ [palladium (II) acetate] ( $34 \mathrm{mg}, 3 \%$ ), and $\mathrm{P}(t-\mathrm{Bu})_{3} \mathrm{HBF}_{4}[$ tri $(t e r t$-butyl)phosphine tetrafluoroborate] ( $73 \mathrm{mg}, 5 \%$ ) in anhydrous toluene ( 50 mL ) was refluxed under Ar for 6 h . After cooled down, the reaction mixture was filtered, and the filtrate was concentrated in vacuo. The resulting crude product was purified by silica gel column chromatography (hexane) to give 3 ( $0.86 \mathrm{~g}, 70 \%$ ) as colorless oil. ${ }^{1} \mathrm{HNMR}$ ( 400 MHz , $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.20(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{ArH}), 7.15(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{ArH}), 7.12(\mathrm{~d}, J$ $=7.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArH}), 7.05(\mathrm{t}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArH}), 6.93(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArH}), 6.72$ $(\mathrm{t}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArH}), 4.77(\mathrm{t}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}), 3.84(\mathrm{t}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH})$, $2.33\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 2.08-1.99\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CH}_{2}\right), 1.95-1.84\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.82-1.75(\mathrm{~m}, 1 \mathrm{H}$, $\left.\mathrm{CH}_{2}\right), 1.70-1.60\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CH}_{2}\right), 1.59-1.47\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CH}_{2}\right)$.

### 2.4.3 3-Chloro-4-(4-(dibutylamino)phenyl)cyclobut-3-ene-1,2-dione (5)

The mixture of squaryl chloride $\mathbf{4}(1.00 \mathrm{~g}, 6.67 \mathrm{mmol}), N, N$-dibutylaniline $\mathbf{1}(1.37 \mathrm{~g}$,
$6.67 \mathrm{mmol})$ in dried toluene ( 50 mL ) was refluxing for 5 h , then the reaction mixture was cooled and evaporated under vacuum. The residue was purified by silica gel column chromatography (hexane/dichloromethane=2:1) to give $5(0.71 \mathrm{~g}, 30 \%)$ as yellow solid. ${ }^{1} \mathrm{HNMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 8.15(\mathrm{~d}, J=9.2 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{ArH}), 6.75$ $(\mathrm{d}, J=9.2 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{ArH}), 3.44\left(\mathrm{t}, J=7.6 \mathrm{~Hz}, 4 \mathrm{H}, \mathrm{CH}_{2}\right), 1.69-1.61\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2}\right)$, 1.46-1.37 (m, 4H, CH2 $), 1.03\left(\mathrm{t}, J=7.2 \mathrm{~Hz}, 6 \mathrm{H}, \mathrm{CH}_{3}\right)$.
2.4.4 3-Chloro-4-(4-(p-tolyl)-1,2,3,3a,4,8b-hexahydrocyclopenta[b]indol-7-yl)cyclob ut-3-ene-1,2-dione (6)

The mixture of squaryl chloride $\mathbf{4}(0.40 \mathrm{~g}, 2.65 \mathrm{mmol}), \mathbf{3}(0.60 \mathrm{~g}, 2.41 \mathrm{mmol})$ in dried toluene ( 30 mL ) was refluxing for 5 h , then the reaction mixture was cooled and evaporated under vacuum. The residue was purified by silica gel column chromatography (hexane/dichloromethane $=2: 1$ ) to give $6(0.22 \mathrm{~g}, 25 \%)$ as orange solid. ${ }^{1} \mathrm{HNMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 8.01(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArH}), 7.96(\mathrm{~s}, 1 \mathrm{H}$, ArH), 7.26-7.16 (m, 4H, ArH), $6.74(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArH}), 4.99(\mathrm{t}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}$, $\mathrm{CH}), 3.89(\mathrm{t}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}), 2.38\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 2.14-2.01\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CH}_{2}\right)$, 1.92-1.85 (m, 2H, CH 2 ), 1.76-1.66 (m, $\left.2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.56-1.44\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CH}_{2}\right)$.

### 2.4.5 3-N,N-(dibutylamino)phenyl-4-hydroxy-3-cyclobutene-1,2-dione (7)

5 ( 0.71 g 2.22 mmol ) was dissolved in a mixture of acetic acid ( 30 mL ), concentrated hydrochloric acid ( 4 mL ) and water ( 10 mL ). This mixture was refluxed for 2 h , and cooled to room temperature. Water ( 200 mL ) was added dropwise into the
mixture, then the yellow precipitate $7(0.59 \mathrm{~g}, 88 \%)$ was obtained by filtration, washed with ether and dried. ${ }^{1} \mathrm{HNMR}$ ( 400 MHz, DMSO- $d_{6}, \mathrm{ppm}$ ) $\delta 7.86(\mathrm{~s}, 2 \mathrm{H}$, ArH), $6.81(\mathrm{~s}, 2 \mathrm{H}, \mathrm{ArH}), 3.38\left(\mathrm{~s}, 4 \mathrm{H}, \mathrm{CH}_{2}\right), 1.49\left(\mathrm{~s}, 4 \mathrm{H}, \mathrm{CH}_{2}\right), 1.34-1.23\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2}\right)$, $0.92\left(\mathrm{t}, J=6.8 \mathrm{~Hz}, 6 \mathrm{H}, \mathrm{CH}_{3}\right)$.
2.4.6 3-Hydroxy-4-(4-(p-tolyl)-1,2,3,3a,4,8b-hexahydrocyclopenta[b]indol-7-yl)cyclo but-3-ene-1,2-dione (8)
$6(0.22 \mathrm{~g}, 0.60 \mathrm{mmol})$ was dissolved in a mixture of acetic acid ( 15 mL ), concentrated hydrochloric acid ( 2 mL ) and water ( 5 mL ). This mixture was refluxed for 6 h , and cooled to room temperature. Water $(100 \mathrm{~mL})$ was added dropwise into the mixture, then the brown precipitate $\mathbf{8}(0.20 \mathrm{~g}, 90 \%)$ was obtained by filtration, washed with ether and dried. ${ }^{1} \mathrm{HNMR}\left(400 \mathrm{MHz}\right.$, DMSO- $\left.d_{6}, \mathrm{ppm}\right) \delta 7.74(\mathrm{~s}, 1 \mathrm{H}, \mathrm{ArH}), 7.72$ $(\mathrm{d}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArH}), 7.26(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{ArH}), 7.23(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{ArH})$, $6.85(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArH}), 4.99(\mathrm{t}, J=6.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}), 3.87(\mathrm{t}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}$, $\mathrm{CH}), 2.30\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 2.11-2.02\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CH}_{2}\right), 1.80-1.60\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2}\right), 1.43-1.33$ (m, 2H, CH2).
2.4.7 4-(4-(Dibutyliminio)cyclohexa-2,5-dien-1-ylidene)-2-(2,6-dihydroxy-4-(8,9,10, 10a-tetrahydrobenzo[e]cyclopenta[b]indol-7(7aH)-yl)phenyl)-3-oxocyclobut-1-enolat $e($ BIBISQ)

A mixture of compound $9(0.17 \mathrm{~g}, 0.53 \mathrm{mmol})$ and $7(0.16 \mathrm{~g}, 0.53 \mathrm{mmol})$ in butanol $(4 \mathrm{~mL})$ and toluene $(12 \mathrm{~mL})$ was refluxed at $140^{\circ} \mathrm{C}$ under Ar for 12 h . Then the
reaction mixture was concentrated in vacuo, and the crude product was purified by column chromatography (dichloromethane) and followed by recrystallization from dichloromethane/methanol to give green shiny crystals of BIBISQ (0.25 g, 78\%). Purity: $100 \%$ (HPLC, eluent: THF/ $\mathrm{CH}_{3} \mathrm{OH}=1: 9$ ). m.p. $219-221^{\circ} \mathrm{C} .{ }^{1} \mathrm{HNMR}(400 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 12.84(\mathrm{~s}, 2 \mathrm{H}, \mathrm{OH}), 8.15(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{ArH}), 7.87(\mathrm{~d}, \quad J=8.0 \mathrm{~Hz}$, $1 \mathrm{H}, \mathrm{ArH}), 7.83(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArH}), 7.79(\mathrm{~d}, J=9.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArH}), 7.71(\mathrm{~d}, J=$ $8.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArH}), 7.53(\mathrm{t}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArH}), 7.44(\mathrm{t}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArH}), 7.09(\mathrm{~s}$, 2H, ArH), 6.40 (s, 2H, ArH), 4.98-4.93 (m, 1H, CH), 4.39-4.34 (m, 1H, CH), 3.44 (t, J $\left.=7.6 \mathrm{~Hz}, 4 \mathrm{H}, \mathrm{CH}_{2}\right), 2.39-2.25\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.12-1.99\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.79-1.67(\mathrm{~m}$, $\left.4 \mathrm{H}, \mathrm{CH}_{2}\right), 1.58-1.49\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.44-1.35\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2}\right), 0.99(\mathrm{t}, J=7.2 \mathrm{~Hz}, 6 \mathrm{H}$, $\mathrm{CH}_{3}$ ). ${ }^{13} \mathrm{CNMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 182.8,178.1,166.5,164.6,155.2,152.6$, $140.1,132.5,130.9,130.7,130.1,128.8,128.6,126.9,124.5,123.3,117.8,115.2$, 112.3, 108.0, 97.0, 69.7, 51.2, 44.7, 35.1, 33.3, 29.6, 24.8, 20.2, 13.9. ## 3. Results and discussion

### 3.1 Synthesis and characterization

The synthetic routes of intermediates and target molecules USQs are outlined in Scheme 2. Compounds 1-9 were prepared according to the procedures described in the literatures. ${ }^{25,27,32,33}$ The two objective molecules BIBISQ and TIBISQ were
prepared by condensation of $\mathbf{9}$ with $\mathbf{7}$ and $\mathbf{8}$, respectively. The molecular structures of the USQs were characterized by ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, HR-ESIMS and element analysis. The purity of both two USQs is conformed to be >99.0\% by HPLC analysis.

Scheme 2. Synthetic routes of two USQs. (a) $\mathrm{Na}_{2} \mathrm{CO}_{3}$ (4.0 equ.), dimethylformamide (DMF) $/ N$-methylpyrrolidinone (NMP) $=9: 1$ (v/v), $120{ }^{\circ} \mathrm{C}, 12 \mathrm{~h}, 85 \%$; (b) NaOBu- $t$ (1.5 equ.), $\mathrm{Pd}(\mathrm{OAc})_{2}$ ( $3 \%$ equ.), $\mathrm{P}\left(t-\mathrm{Bu}_{3} \mathrm{HBF}_{4}\right.$ ( $5 \%$ equ.), anhydrous toluene, reflux under $\mathrm{Ar}, 6 \mathrm{~h}, 70 \%$; (c) anhydrous toluene, reflux under $\mathrm{Ar}, 5 \mathrm{~h}, 30 \%$ for 5 and 25\% for 6; (d) acetic acid/water=3:1 (v/v), concentrated HCl , reflux, 2-6 h, 88\% for 7 and $90 \%$ for 8; (e) $n$-butanol/toluene $=1: 3$ (v/v), $140^{\circ} \mathrm{C}$ under $\mathrm{Ar}, 12 \mathrm{~h}, 78 \%$ for BIBISQ and $73 \%$ for TIBISQ.

### 3.2 Optical properties

The UV-Vis absorption spectra of BIBISQ and TIBISQ in dilute chloroform solution and thin solid films (spin-casted from chloroform solution) are shown in Fig.

1, and the relative data are summarized in Table 1. In solution, analogous to most of squaraines, ${ }^{19-22,25}$ both the two compounds show intense absorption (molar extinction coefficient $>10^{5} \mathrm{M}^{-1} \mathrm{~cm}^{-1}$ ) in Vis-NIR regions. The $\lambda_{\max }$ of BIBISQ and TIBISQ are 691 nm and 713 nm , respectively, with full width at half maxima (FWHM) of 53 nm or 61 nm . In thin film state, both the two compounds display drastically red-shifted and broadened absorption bands ( $\lambda_{\max }$ : 748 nm for BIBISQ, 760 nm for TIBISQ; FWHM: 184 nm for BIBISQ, 217 nm for TIBISQ). This should be attributed to their intense intermolecular interactions in condensed state. The intense and wide absorption band of the two compounds in $500-900 \mathrm{~nm}$ should be beneficial to the harvesting of sunlight hence the enhancement of $J_{s c}$ of their OPV devices. Through the absorption spectra of their solid film samples, the optical bandgap of BIBISQ and TIBISQ is estimated to be 1.47 eV and 1.39 eV , respectively, which is an ideal value for photovoltaic donor materials. ${ }^{28}$

Table 1. Optical and electrochemical properties of the two USQs.

| Compound | $\begin{gathered} \lambda_{\mathrm{abs}}{ }^{a}(\mathrm{~nm}) \\ (\log \varepsilon) \end{gathered}$ | $\begin{aligned} & \lambda_{\mathrm{abs}}{ }^{b} \\ & (\mathrm{~nm}) \end{aligned}$ | FWHM (nm) |  | $E_{g}^{p r}$ <br> (eV) | $E_{\text {ox }}$ <br> (V) | $\mathrm{HOMO}^{c}$ (eV) | $\mathrm{LUMO}^{d}$ <br> (eV) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| TIBISQ | 713 (5.50) | 760 | 61 | 217 | 1.39 | 0.28 | -5.08 | -3.69 |

${ }^{a}$ Measured in dilute chloroform solution $\left(5.00 \times 10^{-6} \mathrm{M}\right) ;{ }^{b}$ measured in thin film state; ${ }^{c}$ HOMO $=\left(-4.80-E_{\mathrm{ox}}\right) \mathrm{eV} ; \quad{ }^{d} \mathrm{LUMO}=E$ ${ }_{8}^{o p t}+$ HOMO.

Fig.1. Absorption spectra of two USQs in solution (a) and thin films (b).

### 3.3 Electrochemical properties

Cyclic voltammetry experiments were carried out on BIBISQ and TIBISQ in dichloromethane solution with tetrabutylammonium perchlorate as the supporting electrolyte, and the results are shown in Table 1 and Fig. 2. The HOMO level of BIBISQ and TIBISQ is estimated to be -5.12 eV and -5.08 eV respectively by comparing the oxidation wave peak of the compounds with $\mathrm{Fc} / \mathrm{Fc}^{+}$redox couple whose energy level is 4.80 eV below vacuum. ${ }^{15}$ And the corresponding LUMO energy level of BIBISQ and TIBISQ is calculated to be -3.65 eV and -3.69 eV , respectively through their HOMO level and optical bandgap data. ${ }^{34}$ From these results, we can roughly guess the $V_{o c}$ of BHJ-OPVs based on these two USQs and $\mathrm{PC}_{71} \mathrm{BM}$ may be in $0.7-0.9 \mathrm{~V} .{ }^{35}$

Fig. 2. Cyclic voltammograms of the two USQs (a) and the energy levels of the components for OPV devices (b).

### 3.4 Photovoltaic characteristics

To evaluate their photovoltaic performance, BHJ-OPV cells with BIBISQ or TIBISQ as electron donor material and [6,6]-phenyl-C 7 $_{71}$ butyric acid methyl ester $\left(\mathrm{PC}_{71} \mathrm{BM}\right)$ as electron acceptor material have been fabricated with different D/A
blending ratios. The device structure is $\mathrm{ITO} / \mathrm{MoO}_{3}(8 \mathrm{~nm}) / \mathrm{USQs}: \mathrm{PC}_{71} \mathrm{BM}(60 \mathrm{~nm}) /$ BCP ( 6 nm )/ Al (100 nm). The corresponding data and curves are shown in Table 2, Fig. 3 and 4. The results indicate that similar trend in photovoltaic performance of OPV devices based on both BIBISQ and TIBISQ could be observed when their D/A ratio varies from 1:1 to $1: 8$. Taking TIBISQ as an example, when the blend ratio is changed from 1:1 to $1: 8$, the $V_{o c}$ and FF of the corresponding BHJ-OPV devices are nearly unaltered, while the $J_{s c}$ is found to show distinct variation, which matches with the corresponding EQE spectra of the devices. As shown in Fig 3b, in the EQE spectra of TIBISQ-devices, three major bands could be identified, with their peaks approximately located at $380 \mathrm{~nm}, 480 \mathrm{~nm}$ and 760 nm , respectively. The first two high-energy bands should stem from the absorption of $\mathrm{PC}_{71} \mathrm{BM}$; and the third low-energy band at $\sim 760 \mathrm{~nm}$ should arise from the absorption of TIBISQ. With the increasing composition of TIBISQ, the intensity of the third band peaked at $\sim 760 \mathrm{~nm}$ increases gradually, which is consistent with the corresponding absorption spectrum of D/A blend film with similar D/A mixing ratio (shown in Fig. 3c). Accordingly, with increasing D/A ratio from 1:8 to $1: 3$, the $J_{\mathrm{sc}}$ of TIBISQ-device increases gradually from 10.92 to $13.02 \mathrm{~mA} \mathrm{~cm}^{-2}$. However, in the case of TIBISQ-device with D/A ratio of $1: 1$, the intensity of the third band in its EQE spectrum decreases rather than increased drastically, despite the fact that the $1: 1$ blend film displays the strongest absorption at this band, as shown in Fig. 3c. This may ascribed to the drastically different morphology of the blend films between 1:1 and other D/A ratios (vide Fig. 5). Similarly, for BIBISQ-devices, the optimized D/A ratio is also found to be $1: 3$.

Therefore, taking advantage of the more effective absorption in the NIR region due to the increased content of USQ in the $1: 3$ optoelectronic film, the resulting devices could both show impressive $J_{\mathrm{sc}}$ of $\sim 13 \mathrm{~mA} \mathrm{~cm}^{-2}$, which is much higher than that of the reported USQ-based BHJ-SMOPVs. ${ }^{15,25}$ Additionally, according to the experimental and calculation results (Fig. 6), the hole mobility of the as-prepared 1:3 D/A blending films is relatively high $\left(3.25 \times 10^{-5}\right.$ and $6.21 \times 10^{-5} \mathrm{~cm}^{2} \mathrm{~V}^{-1} \mathrm{~s}^{-1}$ for BIBISQ- and TIBISQ-based film in sequence), which would also contribute to the high $J_{\text {sc }}$ and FF, ${ }^{36}$ hence high PCE of $4.97 \% \sim 5.08 \%$ of the devices.

Table 2. Photovoltaic performance of USQs-OPV devices.

| Active layer (w/w) | $V_{\text {oc }}(\mathrm{V})$ | $J_{\text {sc }}\left(\mathrm{mA} / \mathrm{cm}^{2}\right)$ | FF | PCE (\%) ${ }^{b}$ |
| :---: | :---: | :---: | :---: | :---: |
| TIBISQ:PC ${ }_{71} \mathrm{BM}=1: 1$ | 0.83 | 9.95 | 0.45 | 3.72 (3.65) |
| TIBISQ:PC ${ }_{71} \mathrm{BM}=1: 3$ | 0.83 | 13.02 | 0.47 | 5.08 (5.03) |
| TIBISQ:PC ${ }_{71} \mathrm{BM}=1: 5$ | 0.84 | 11.15 | 0.50 | 4.68 (4.57) |
| TIBISQ:PC ${ }_{71} \mathrm{BM}=1: 8$ | 0.84 | 10.92 | 0.48 | 4.40 (4.32) |
| TIBISQ:PC ${ }_{71} \mathrm{BM}=1: 3^{a}$ | 0.83 | 13.50 | 0.49 | 5.49 (5.39) |
| BIBISQ:PC ${ }_{71} \mathrm{BM}=1: 1$ | 0.83 | 8.23 | 0.43 | 2.94 (2.81) |
| BIBISQ:PC ${ }_{71} \mathrm{BM}=1: 3$ | 0.84 | 12.87 | 0.46 | 4.97 (4.92) |
| BIBISQ:PC ${ }_{71} \mathrm{BM}=1: 5$ | 0.85 | 10.97 | 0.49 | 4.57 (4.46) |
| BIBISQ:PC ${ }_{71} \mathrm{BM}=1: 8$ | 0.86 | 10.41 | 0.47 | 4.21 (4.13) |
| BIBISQ:PC ${ }_{71} \mathrm{BM}=1: 3^{a}$ | 0.83 | 13.13 | 0.49 | 5.34 (5.24) |

Fig. 6. Current density-voltage characteristics of hole-only single-carrier devices using USQs: $\mathrm{PC}_{71} \mathrm{BM}=1: 3$ blend films as active layer

Upon thermal annealing ( $80{ }^{\circ} \mathrm{C}, 10 \mathrm{~min}$ ), the device performance of both BIBISQ and TIBISQ is observed to be enhanced, with PCE of $5.34 \%$ and $5.49 \%$, respectively. The enhanced PCEs should be attributed not only to the improved $J_{s c}$ (for BIBISQ, from 12.87 to $13.13 \mathrm{~mA} \mathrm{~cm}^{-2}$; for TIBISQ, from 13.02 to $13.50 \mathrm{~mA} \mathrm{~cm}^{-2}$ ) which is consistent with their EQE measurement results (shown in Fig. 3b and Fig. 4b), but also to the enhanced FF (for BIBISQ, from 0.46 to 0.49 ; for TIBISQ, from 0.47 to 0.49). Moreover, the impressive $J_{s c}\left(13.50 \mathrm{~mA} \mathrm{~cm}^{-2}\right)$ and excellent PCE ( $5.49 \%$ ) of TIBISQ-based BHJ-OPV could compare to the highest $J_{\mathrm{sc}}{ }^{29}$ and PCE ${ }^{17,30,31}$ among all the reported squaraine based BHJ-OPV cells. These results indicate that the Y-mannered molecular backbone is indeed quite promising for the construction of perspective OPV USQs with increased donor content in photoactive layer.

It is worthwhile to mention that the optimized D/A composite ratio in these devices based on two USQs is $1: 3$. Generally, a larger content of donor material in the blend film is propitious to the harvesting of sunlight hence the enhancement of PCE of the device, ${ }^{37}$ therefore, the typical D/A ratio in highly efficient OPV devices lies in the
range of 1:1~1:2. ${ }^{9}$ However, although many D/A composite ratio has been employed in the BHJ OPV devices based on squaraines, the record PCE of $5.50 \%$ for BHJ-OPV using symmetrical squaraines (SSQs, D-A-D-type) could be achieved with a rather low D/A ratio (1:6) according to Wei's report. ${ }^{17}$ Similarly, for our reported USQs donor materials, the optimized D/A ratios fall into the region of 1:8~1:5. ${ }^{19-22}$ The low content of donor material in photoactive layer may hamper the photovoltaic performance of these squaraine materials. Therefore, the present investigation shows the much enhanced content of USQ donor materials in active layers (the optimized D/A ratios of BHJ-OPVs based on BIBISQ and TIBISQ are both 1:3) is beneficial to absorb more solar light in the NIR region, which contributes to the impressive $J_{s c}$ over $13 \mathrm{~mA} \mathrm{~cm}^{-2}$ and PCE over $5 \%$ of BHJ-OPVs, which would open a more confident way to improve OPV performances of squaraine materials by molecular tailoring.

## 4. Conclusion

In conclusion, two novel USQs bearing Y-manner molecular platform have been developed. Both of them show relatively low bandgap of $<1.5 \mathrm{eV}$, intense and wide absorption band in 500-900 nm, and relatively low HOMO energy level of $\sim-5.10 \mathrm{eV}$ as well. BHJ-OPV devices based on them could show relatively high $V_{o c}$ of 0.84 V , rather impressive $J_{s c}$ of over $13 \mathrm{~mA} \mathrm{~cm}^{-2}$ and high FF of 0.49 , consequently high PCE of over $5.0 \%$ even at a relatively high donor content (the optimized D/A ratio is 1:3). Consequently, Y-manner is indeed a quite promising linking way for the construction of high performance OPV USQs in terms of increased donor content.
