Imidazolium salts linked by an ethyl tether to *closo*-dicarbadodecaboranes were reacted with [IrCp*Cl₂]₂, [RhCp*Cl₂]₂ or [Ru(*p*-cymene)Cl₂]₂ in the presence of Ag₂O to prepare complexes of the type [MCp*(NHC)Cl₂] (M = Ir, Rh; NHC = N-heterocyclic carbene) or [Ru(*p*-cymene)(NHC)Cl₂]. When the NHC contained an N-^tBu substituent, C-H activation of the ^tBu and subsequent alkyl coordination was observed at Ir. Coordination of the *closo*-dicarbadodecaborane moiety to Ir was possible to give 7-membered metallacycles, coordinated through the carbenic carbon of the NHC and either a carbon atom or a boron atom of the carborane. Examination of the Ir complexes in the transfer hydrogenation of acetophenone to 1-phenylethanol reveals that cyclometallation of the carborane moiety is important for catalytic efficacy, indicating a bifunctional mechanism and involvement of the dicarbadodecaborane anion.

Introduction

N-Heterocyclic carbenes (NHCs) represent an attractive alternative to phosphines as ligands in many organometalliccatalysed reactions, and are showing promise in the biomedical field.¹⁻⁶ Advantages of NHCs over common ligand types include the strong metal-carbene bond which is able to stabilise an array of metals in various oxidation states, and the ability to fine-tune the steric and electronic effects of the ligand through modification of nitrogen substituents and backbone substituents respectively. Nitrogen substituents on NHCs are usually alkyl or aryl groups, with neutral (e.g. pyridyl, $(e.q. alkoxide, amide)^{16-20}$ donor functionalities often being incorporated into the substituents. These tethering groups enable ligands to chelate a metal centre, allowing fine control over stability, steric and electronic properties. The N-substituents may further become involved in catalysis in a bifunctional manner, for example in academically and industrially viable hydrogenation and transfer hydrogenation reactions.²¹⁻²⁴

Lavallo and co-workers have previously reported NHC ligands bearing a *closo*-carbadodecaborate substituent.^{25, 26} Coordination of the ligands to Au through the NHC yields zwitterionic and anionic complexes.²⁷ We have recently introduced a new class of NHC ligands which contain either a *closo*-dicarbadodecaborane (neutral and anionic) or a *nido*-dicarbaundecaborane dianion.²⁸ Versatile coordination to Rh¹

CCDC: 1481052, 1481054-1481058, 1481060-1481061

through both the NHC and either a *closo*-dicarbadodecaborane anion, or a *nido*-dicarbaundecaborane dianion was demonstrated. The *nido*-carborane ligands furnish homobimetallic complexes, whereas the *closo*-carborane ligand chelates the Rh¹ centre, coordinating through both the NHC and a carbon atom of the carborane. Herein, we report a valuable addition to the NHC-carborane ligand class, and their reactivity with Ir^{III} , Rh^{III} and Ru^{II}. Examination of the Ir^{III} complexes in the transfer hydrogenation of acetophenone to 1-phenylethanol demonstrates that the complexes are catalytically viable, with a profound ligand effect observed upon cyclometallation.

Results and discussion

Ligand precursors 1a-1c were identified for this study and were prepared using a convenient nucleophilic substitution reaction.²⁸ Reaction of 1-bromoethyl-1,2-dicarba-closododecaborane with a stoichiometric amount of N-^tbutyl or Nmethyl imidazole in a minimal amount of anhydrous toluene at 100 °C gave the corresponding imidazolium bromide salts 1a and 1b respectively (Scheme 1). (1-Bromoethyl)(2-methyl)-1,2dicarba-closo-dodecaborane was prepared from 1-methyl-1,2dicarba-closo-dodecaborane (see experimental) and reacted with N-methyl imidazole to give imidazolium bromide 1c. The novel salts 1b and 1c were fully characterised using multinuclear NMR spectroscopy, mass spectrometry, elemental analysis and X-ray crystallography. The solid-state structures of 1b and 1c show an ethyl tether linking a nitrogen atom of the imidazolium with a carbon atom of each carborane (Figure 1). The carboranyl carbon atoms were identified using the VCD method, $^{\rm 29}$ with the carboranyl C-H

ARTICLE

proton in **1b** resonating at 5.37 ppm in the 1 H NMR spectrum (500 MHz, dmso-d₆).

Scheme 1 Synthesis of imidazolium ligand precursors 1a-1c.

Fig 1 Molecular structure of imidazolium bromide salts **1b** (top) and **1c** (bottom). H atoms are omitted for clarity and thermal ellipsoids are depicted at 50% probability.

Reaction of compound **1a** with [IrCp*Cl₂]₂ in the presence of Ag₂O in CH₂Cl₂ gave an Ir^{III}-NHC complex **3a** (Scheme 2). In addition to NHC formation, the ¹H NMR spectrum revealed that C-H activation of a methyl of the ^tBu group had occurred, with concomitant coordination to the metal. The non-equivalent diastereotopic protons of the metallated CH₂ group appear at 3.06 and 2.39 ppm in the ¹H NMR spectrum (300 MHz, CD₂Cl₂), with a coupling of 12.0 Hz. The non-cyclometallated complex **2a** was not observed in this reaction, indicating that aliphatic C-H activation is facile, as previously seen in related Ir^{III}-NHCs.³⁰

Scheme 2 Reaction of imidazolium 1a with an Ir^{II} precursor and Ag_2O to yield cyclometallated complexes 3a and 4a.

Our previous work has shown that solvent-assisted C-H activation/deprotonation of the carborane moiety occurs in MeCN,²⁸ hence the reaction with **1a** was carried out in MeCN with excess Ag₂O. In addition to Ir-NHC formation, cyclometallation through the carborane did occur to give 4a, though in this case the closo-dicarbadodecaborane anion coordinates to the metal through a boron atom, rather than a carbon atom as observed in Rh¹ complexes.²⁸ This was confirmed through the observation of a broad resonance at 3.21 ppm, integrating to 1H in the ¹H NMR spectrum (500 MHz, C₆D₆), indicative of the carboranyl C-H remaining protonated. The ¹H NMR spectrum of **4a** exhibits two sets of resonances in a 7:3 ratio due to diasteroisomers, as a result of the sterogenic metal centre and a mixture of B3 and B6 metallation.^{31, 32} Crystals of complex **4a** suitable for X-ray diffraction analysis were obtained from slow evaporation of a MeCN solution, and provide unambiguous confirmation that intramolecular C-H activation of the ^tBu group had occurred to give a five-membered metallacycle, with a C-Ir-C bite angle of 76.27(12) ° (Figure 2). In addition, coordination through a boron atom of the closo-carborane results in a sevenmembered metallacycle, with a C-Ir-B bite angle of 85.65(14) °, forming an interesting and structurally distinct (7,5)-bicyclometallated system. The molecular structure of 4a can be regarded as a distorted piano stool geometry, with an Ir-C_{carbene} bond length of 1.956(3) Å, which is comparatively short for IrCp*(NHC)-type complexes.³³⁻³⁷ The Ir-CH₂ distance of 2.128(3) Å is moderately long compared to other $\rm Ir^{III}\mbox{-alkyl-cyclometallated complexes.}^{30, 33, 38}$ The carboranyl carbon atoms were determined using the VCD method, and revealed a particularly elongated B3 vertex to centroid distance of 1.89 Å, which are typically in the range 1.72-1.78 Å.^{31, 39} It can be proposed that the metallated carborane B vertex elongates to relieve steric encumbrance close to the metal centre.

Fig 2 Molecular structure of Ir^{III}-NHC complex **4a**. H atoms are omitted for clarity and thermal ellipsoids are depicted at 50% probability.

Complexes **3a** and **4a** were isolated in relatively low (but useable) yields, with attempts to improve them unsuccessful. Therefore, to increase yield and enable isolation of a non-cyclometallated $Ir^{III}Cp^*(NHC)Cl_2$ -type complex of an NHC-carborane ligand, the sterics were reduced by replacing the ^tBu substituent of the NHC with a methyl group (**1b**). Ligand precursor **1b** was reacted with $[IrCp^*Cl_2]_2$ under the same

conditions as previously to give the desired Ir^{III}Cp*(NHC)Cl₂ complex 2b in excellent yield (Scheme 3). The corresponding RhCp*(NHC)Cl₂ (5b) and Ru(p-cymene)(NHC)Cl₂ (6b) complexes were also synthesised in good yield using analogous procedures. Complexes 2b, 5b and 6b were fully characterised by multinuclear NMR spectroscopy, mass spectrometry and elemental analysis. As expected, upon deprotonation and subsequent coordination of the NHC group, the imidazolium C2-proton resonance is absent from the ¹H NMR spectra in each case. The CH₂ protons of the ethyl linkers are diastereotopic, indicating hindered rotation about the M-C_{carbene} bonds at room temperature. Furthermore, there appears to be a second minor product in the ${}^{1}\mathrm{H}$ NMR spectrum, with two resonances that appear close together for both the N-Me and Cp* groups. This may be due to the complexes being in equilibrium with cyclometallated derivatives in solution,⁴⁰ though mass spectrometry and elemental analysis data are indicative of only the noncyclometallated products. The carboranyl C-H resonances appear at 4.45 ppm (2b), 4.62 ppm (5b) (300MHz, CDCl₃) and 4.54 ppm (**6b**) (500MHz, CD_2Cl_2), and the ¹¹B{¹H} NMR spectra display characteristic resonances for closo-carboranes, with peaks ranging from -2 to -13 ppm.

complexes **2b**, **5b** and **6b**.

Crystals of **2b** and **6b** suitable for X-ray diffraction analysis were obtained from CH₂Cl₂/hexane and slow evaporation of a concentrated MeCN solution respectively. The solid-state structures (Figure 3) show piano stool geometry around the metal centres, with each metal bearing two chloride atoms, an NHC and either Cp* (**2b**) or *p*-cymene (**6b**). The M-C_{carbene} bond lengths of 1.92(3) Å (**2b**) and 2.064(7) Å (**6b**) are relatively short when compared to other IrCp*(NHC)Cl₂ and Ru(*p*-cymene)(NHC)Cl₂ complexes in the literature, ^{37, 41-45} which may be an effect of the carborane substituent causing the carbenic carbon to be more nucleophilic than other NHCs.

Fig. 3 Molecular structure of complexes 2b (top) and 6b (bottom). H atoms are omitted for clarity and thermal ellipsoids are depicted at 30% (2b) and 50% (6b) probability.

Similarly to complex 3a, the Ir complex 2b underwent cyclometallation upon reaction with Ag₂O in MeCN. Following cyclometallation, the NMR data revealed two overlapping sets of resonances, which were assigned as a mixture of C_{carborane}and B_{carborane}-cyclometallated complexes 7b and 8b (Scheme 4). The carboranyl C-H appears as two resonances in the 1 H NMR spectrum, attributable to a diasterotopic mixture of B3 and B6 metallation. Mass spectrometry data revealed just one signal at 579.3350, attributable to [**7b/8b**-Cl]⁺, with elemental analysis providing evidence for the presence of only 7b and/or **8b**. It is intriguing that the N-^tBu substituted ligand leads selectively to only B-cyclometallation (4a), whereas a mixture of B- and C-cyclometallation is observed with the N-Me substituted ligand. Such selectivity in 4a is likely due to elongation of the B vertex allowing reduction of steric encumbrance around the metal, which is not necessary in the case of the N-Me substituted ligand. Surprisingly, Rh and Ru complexes 5b and 6b do not cyclometallate under the same reaction conditions, which may indicate that an M-C/B interaction occurs prior to deprotonation, with the higher charge density of Ir^{III} compared to Rh^{III} and Ru^{II} rendering the C-H/B-H proton more acidic.

Scheme 4 Synthesis of mixed metallacycles 7b and 8b.

ARTICLE

To negate the formation of a mixture of cyclometallated products, an alternative route was developed to furnish complex 7b (Scheme 5). Ligand precursor 1b was reacted with ⁿBuLi to deprotonate both the imidazolium NCHN proton and the carboranyl CH proton, followed by reaction with [IrCp*Cl₂]₂. Analysis of the resulting product revealed NHC coordination and Ir-C_{carborane} cyclometallation, however, halide exchange had also occurred to give a mixture of Ir-Cl and Ir-Br (originating from LiBr). X-ray crystallography analysis showed 70% bromide and 30% chloride occupancy in the solid-state (Figure 4). To remove bromide ions from the reaction, attempts were made to synthesise the imidazolium chloride 1-chloroethyl-1,2-dicarba-closoprecursor from ligand dodecaborane, though the nucleophilic substitution reaction was sluggish, furnishing 7% product which was contaminated with nido-carborane species.

Scheme 5 Synthesis of Ir-NHC-C_{carborane} metallacycle 7b (top), and Ir-NHC-B_{carborane} metallacycle 8c via non-cyclometallated complex 2c (bottom).

Fig. 4 Molecular structure of complex 7b. H atoms are omitted for clarity and thermal ellipsoids are depicted at 50% probability. The halide labelled Br(1) was found to be a mixture of Br (70%) and Cl (30%).

To prepare a cyclometallated complex that coordinates through a carboranyl boron atom, C-Me protected ligand precursor **1c** was reacted with $[IrCp*Cl_2]_2$ in the presence of Ag₂O. As previously observed, reaction in CD₂Cl₂ furnishes the non-cyclometallated product **2c**. X-ray diffraction analysis of complex **2c** showed the expected IrCp*(NHC)Cl₂ species, with an Ir-C_{carbene} bond length of 2.002(18) Å (Figure 5). As observed

in **2b**, complex **3c** undergoes cyclometallation upon reaction with Ag_2O in MeCN to give **8c** in 44% yield.

Fig. 5 Molecular structure of complex 2c. H atoms are omitted for clarity and thermal ellipsoids are depicted at 50% probability.

Catalytic viability in transfer hydrogenation

The reduction of ketones *via* transfer hydrogenation provides a mild route to secondary alcohols without the need for pressurised H₂ gas.⁴⁶ Several different metals have been shown to catalyse the transfer hydrogenation reaction, including Ir, Rh and Ru, many of which contain NHC ligands.^{21-23, 36} To assess the catalytic feasibility of our novel Ir^{III} complexes bearing NHC-carborane ligands, complexes **2b**, **7b**/**8b** mixture, **7b** and **8c** were examined in the transfer hydrogenation of acetophenone, alongside [IrCp*Cl₂]₂ as a benchmark reaction (Table 1). Furthermore, as a dicarbadodecaborane is thought to mimic the sterics created by rotation of a planar phenyl group through 360°, the phenyl derivative **2d** was prepared and examined for useful comparison, in addition to the cyclometallated phenyl complex **7e** (Scheme 6).

Scheme 6 Synthesis of phenyl-derivatives 2d and 7e.

	Catalyst	Catalyst Loading (mol%)	Conversion (%) [#]
1	No catalyst	0	8
2	[IrCp*Cl ₂] ₂	1 ^Δ	68
3	2b	1	33
4	2d	1	25
5	7b/8b	1	>99
6	7b/8b	0.5	91
7	7b	1	75
8	8c	1	>99
9	8c	0.5	82
10	7e	1	39
11	7b/8b $^{+}$	1	0

Conditions: Acetophenone (1 mmol), 2-propanol (2.3 mL, 30 mmol), [†]BuOK (0.1 mmol, [†]no base added), catalyst (^Δ1.0 mol% per Ir), internal standard = 1,3,5-trimethoxybenzene (0.33 mmol), 82 °C, 1 hour. [#]Conversion was calculated by ¹H NMR spectroscopy, by measuring the integration of the methyl resonance of 1-phenylethanol and comparing to the TMB internal standard. Conversion values are an average of two separate runs.

The transfer hydrogenation reaction with $[IrCp*Cl_2]_2$ as the catalyst gave a reasonable conversion of 68% after 1 hour (entry 2). Incorporating an NHC ligand with a dicarbadodecaborane substituent (2b) into the complex had a significant deactivating effect, with a conversion of 33% after 1 hour (entry 3), which decreased further to 25% when exchanging the dicarbadodecaborane group for phenyl (2d) (entry 4). However, cyclometallation of the carborane moiety enhances catalysis greatly compared to the noncyclometallated counterparts (entries 5-9). The C/Bcyclometallated mixture 7b/8b catalyses the hydrogenation of acetophenone to 1-phenylethanol quantitatively after 1 hour (entry 5), with a 91% conversion when the catalyst loading is lowered to 0.5 mol% (entry 6). When using 1.0 mol% of the Ccyclometallated complex 7b, a conversion of 75% was achieved after 1 hour (entry 7), which indicates that the Bcyclometallated complex is more active than the Ccyclometallated. Indeed, when B-cyclometallated complex 8c

This journal is © The Royal Society of Chemistry 20xx

was tested, quantitative conversion was observed with 1.0 mol% after 1 hour (entry 8). However, 0.5 mol% 8c yielded 82% conversion (entry 9), which is lower than the C/Bcyclometallated mixture 7b/8b. This indicates that either the Ir-halide has an effect on catalysis, with CI being more activating than Br, or that the mixed C/B-cyclometallated complexes work synergistically. Cyclometallation of a phenyl group has little effect upon the outcome of the reaction, with a conversion of only 39% when using complex 7e (entry 10). The significant enhancement in activity upon cyclometallation of a carborane substituent, which is not observed upon cyclometallation of a phenyl substituent, is likely a result of metal-ligand bifunctional catalysis, in which the carborane anion becomes involved. Conducting the transfer hydrogenation reaction in the absence of ^tBuOK shuts down catalysis (entry 11), which may suggest that the active catalyst is an alkoxide rather than a chloride species. Based upon these findings, a proposed mechanism for the transfer hydrogenation reaction is given in Scheme 7, which may proceed via an inner-sphere²² or an outer-sphere⁴⁷ mechanism.

 $[\]label{eq:scheme 7} \begin{array}{ll} \mbox{Proposed inner-sphere or outer-sphere mechanism for the transfer hydrogenation of acetophenone catalysed by an Ir^{II} complex bearing a cyclometallated NHC-dicarbadodecaborane ligand. \end{array}$

Conclusion

In summary, we have reported a series of complexes bearing NHC-carborane ligands. Variable coordination has been observed through the NHC and through either a carbon atom or a boron atom of the carborane, which highlights their potential as a flexible and distinct ligand class. Through judicious choice of reaction conditions and ligand precursor, selective C- or B-cyclometallation can be effected. The

ARTICLE

cyclometallated complexes are validated active catalysts in the transfer hydrogenation of acetophenone, with a bifunctional mechanism proposed in which the dicarbadodecaborane moiety is involved.

Experimental

General

All manipulations were carried out under an inert atmosphere by means of standard Schlenk line or Glovebox techniques. Anhydrous solvents were prepared by passing over activated alumina to remove water, copper catalyst to remove oxygen and molecular sieves to remove any remaining water, via the Dow-Grubbs solvent system, and then freeze-pump-thaw 1-^tButylimidazole,⁴⁸ degassed prior to use. 6,9bis(acetonitrile)decaborane, 49 1-bromoethyl-1,2-dicarba-closododecaborane, ⁵⁰ 1-methyl-1,2-dicarba-*closo*-dodecaborane, ⁵⁰ [Ir(Cp*)Cl₂]₂, ⁵¹ [Rh(Cp*)Cl₂]₂, ⁵¹ [Ru(*p*-cymene)Cl₂]₂, ⁵² 1d, ⁵³ 1e⁴¹ and $\mathbf{7e}^{41}$ were prepared using literature methods. All other reagents were purchased and used without further purification. NMR spectra were recorded on a Bruker AV500 or a Bruker DPX300 spectrometer. ¹H NMR and ¹³C{¹H} NMR chemical shifts were referenced against residual solvent peaks. The ¹¹B{¹H} NMR spectra were referenced externally to $BF_3.OEt_2$. Assignment of ¹H and ¹³C{¹H} NMR spectra for all complexes was aided by the use of 2D $^1\text{H}^1\text{H}$ COSY, $^1\text{H}^{13}\text{C}$ HMQC, ¹H¹³C HMBC and ¹³C{¹H} DEPT 135 experiments. Mass spectra were collected on a Bruker Daltonics (micro TOF) instrument operating in the electrospray mode. Elemental analyses were performed by Mr Stephen Boyer at London Metropolitan University.

(1-Hydroxyethyl)(2-methyl)-1,2-dicarba-closo-dodecaborane

1-Methyl-1,2-dicarba-closo-dodecaborane (300 mg, 1.90 mmol) was added to a Schlenk flask and degassed. Anhydrous THF (10 mL) was added and cooled to -78°C. A 1.6 M solution of ⁿBuLi in hexane (1.17 mL, 1.87 mmol) was added dropwise and stirred for 30 minutes at -78°C. The temperature was raised to 0°C and a 2.5 M solution of ethylene oxide in THF (1.13 mL, 2.81 mmol) was added dropwise and stirred at 0°C for 1 hour. The reaction was quenched by adding a saturated solution of NH₄Cl (5 mL), and the aqueous phase was extracted with ethyl acetate (3 \times 10 mL). The organic fractions were combined and dried over MgSO₄, filtered and solvent removed in vacuo. Hexane (3 mL) was added and cooled to -15°C for 3 hours. The resulting white crystals were filtered, washed with hexane at 0°C (5 mL) and dried in vacuo. Yield: 325 mg, 1.61 mmol (85 %). ¹H NMR (500 MHz, dmso-d₆): δ 4.87 (s, 1H, OH), 3.56 (t, J = 5 Hz, 2H, CH₂OH), 2.44 (t, J = 5 Hz, 2H, CH₂), 2.09 (s, 3H, CH₃). ¹³C{¹H} NMR (126 MHz, dmso-d₆): δ 77.2 (carboranyl quaternary C), 76.0 (carboranyl quaternary C), 59.5 (CH₂OH), 36.9 (CH₂), 22.6 (CH₃). ¹¹B{¹H} NMR (161 MHz, dmso-d₆): δ -4.9 (1B), -6.4 (1B), -8.9 (2B), -10.0 (2B), -10.9 (4B). Anal. Calcd for C₅H₁₈B₁₀O: C, 29.69; H, 8.97. Found: C, 29.77; H, 9.02.

(1-Bromoethyl)(2-methyl)-1,2-dicarba-closo-dodecaborane

To a Schlenk flask was added (1-hydroxyethyl)(2-methyl)-1,2dicarba-closo-dodecaborane (360 mg, 1.78 mmol) and anhydrous CH₂Cl₂ (5 mL). This was cooled to 0°C and PPh₃ (543 mg, 2.07 mmol) and N-bromosuccinimide (368 mg, 2.07 mmol) was added and stirred at 0°C for 3 hours. The organic phase was washed with H_2O (4 × 10 mL), dried over MgSO₄, filtered and the solvent removed in vacuo. Et₂O (10 mL) was added and the suspension was filtered through a 5 cm silica plug which was flushed with Et_2O (2 × 10 mL). The solvent was removed from the filtrate in vacuo to give the product as a white crystalline solid. Yield: 365 mg, 1.38 mmol (78 %). ¹H NMR (500 MHz, dmso-d₆): δ 3.60 (t, J = 10 Hz, 2H, CH₂Br), 2.86 (t, J = 10 Hz, 2H, CH₂), 2.12 (s, 3H, CH₃). ¹³C{¹H} NMR (126 MHz, dmso-d₆): δ 76.9 (carboranyl quaternary C), 76.2 (carboranyl quaternary C), 36.5 (CH₂Br), 28.9 (CH₂), 22.4 (CH₃). ¹¹B{¹H} NMR (161 MHz, dmso-d₆): δ -4.4 (1B), -6.3 (1B), -9.0 (2B), -9.9 (2B), -10.9 (4B). Anal. Calcd for C₅H₁₇B₁₀Br: C, 22.65; H, 6.46. Found: C, 22.77; H, 6.48.

Compound 1a

1-Bromoethyl-1,2-dicarba-closo-dodecaborane (500 mg, 1.99 mmol), 1-^tbutylimidazole (246 mg, 1.98 mmol) and anhydrous toluene (3 mL) were added to an ampoule and heated at 100°C for 18 hours. The reaction was cooled to room temperature, filtered, and the solid washed with toluene (3 × 10 mL) to give an off white crystalline solid. This was recrystallised from MeOH (3 mL) / Et₂O (30 mL), filtered and dried in vacuo to give 1a as a white crystalline solid. Yield: 529 mg, 1.41 mmol (71 %). ¹H NMR (500 MHz, dmso-d₆): δ 9.41 (s, 1H, imidazolium NCHN), 8.03 (t, J = 1.9 Hz, 1H, imidazolium NCH), 7.90 (t, J = 1.9 Hz, 1H, imidazolium NCH), 5.38 (br. s, 1H, carboranyl CH), 4.33 (m, 2H, CH_2), 2.99 (m, 2H, CH_2), 1.57 (s, 9H, $(CH_3)_3$). ¹³C{¹H} NMR (126 MHz, dmso-d₆): δ 134.9 (imidazolium NCN), 122.6 (imidazolium NCH), 120.2 (imidazolium NCH), 72.4 (carboranyl quaternary C), 63.2 (carboranyl CH), 59.6 (C(CH₃)₃), 47.0 (CH₂), 35.3 (CH₂), 28.9 ((CH₃)₃). $^{11}B{}^{1}H{}$ NMR (161 MHz, dmso-d₆): δ -2.8 (1B), -5.5 (1B), -9.6 (2B), -11.8 (6B). Compound 1b

Compound 1b was prepared as described for 1a, from 1bromoethyl-1,2-dicarba-closo-dodecaborane (500 mg, 1.99 mmol) and 1-methylimidazole (162 mg, 1.97 mmol). Following purification the product was isolated as a fluffy crystalline white solid. Yield: 490 mg, 1.47 mmol (75 %). ¹H NMR (500 MHz, dmso-d₆): δ 9.21 (s, 1H, imidazolium NCHN), 7.84 (t, J = 2.0 Hz, 1H, imidazolium NCH), 7.71 (t, J = 2.0 Hz, 1H, imidazolium NCH), 5.37 (br. s, 1H, carboranyl CH), 4.35 (m, 2H, CH₂), 3.86 (s, 3H, CH₃), 2.94 (m, 2H, CH₂). ¹³C{¹H} NMR (126 MHz, dmso-d₆): δ 137.0 (imidazolium NCN), 123.6 (imidazolium NCH), 122.3 (imidazolium NCH), 72.5 (carboranyl quaternary C), 63.1 (carboranyl CH), 46.9 (CH₂), 35.8 (CH₃), 35.3 (CH₂). ¹¹B{¹H} NMR (161 MHz, dmso-d₆): -3.0 (1B), -5.6 (1B), -9.7 (2B), -11.8 (4B), -12.9 (2B). HRMS (ESI+): m/z $[C_8H_{21}B_{10}N_2]^+$ 253.2714, Calcd for $[M-Br]^+$ 253.2706. Anal. Calcd for C₈H₂₁B₁₀N₂Br: C, 28.83; H, 6.35; N, 8.41. Found: C, 28.72; H,

6.41; N, 8.27. Crystals suitable for X-ray diffraction analysis were grown via slow diffusion of Et_2O into a concentrated solution of **1b** in MeCN.

Compound 1c

Compound 1c was prepared as described for 1a, from (1bromoethyl)(2-methyl)-1,2-dicarba-closo-dodecaborane (100 mg, 0.38 mmol) and 1-methylimidazole (31 mg, 0.38 mmol) in anhydrous toluene (1 mL), with a reaction time of 6 hours. After purification the product was obtained as a fluffy crystalline white solid. Yield: 79 mg, 0.23 mmol (61 %). ¹H NMR (300 MHz, CD₃OD): δ 9.07 (s, 1H, imidazolium NCHN), 7.75 (m, 1H, imidazolium NCH), 7.59 (m, 1H, imidazolium NCH), 4.46 (m, 2H, CH₂), 3.93 (s, 3H, CH₃), 2.95 (m, 2H, CH₂), 2.15 (s, 3H, carboranyl CH₃). $^{13}C{^1H}$ NMR (75 MHz, CD₃OD): δ 138.5 (imidazolium NCN), 125.1 (imidazolium NCH), 123.8 (imidazolium NCH), 77.5 (carboranyl quaternary C), 75.6 (carboranyl quaternary C), 48.9 (CH₂), 36.6 (CH₂), 35.2 (CH₃), 23.6 (carboranyl-CH₃). ¹¹B{¹H} NMR (96 MHz, CD₃OD): -3.9 (1B), -5.9 (1B), -9.6 (4B), -10.5 (4B). HRMS (ESI+): m/z $[C_9H_{23}B_{10}N_2]^+$ 267.2875, Calcd for $[M-Br]^+$ 267.2863. Anal. Calcd for C₉H₂₃B₁₀N₂Br: C, 31.13; H, 6.68; N, 8.07. Found: C, 31.02; H, 6.79; N, 8.12. Crystals suitable for X-ray diffraction analysis were grown via slow diffusion of Et₂O into a concentrated solution of 1c in MeCN.

Ir complex 3a

To a Schlenk flask was added 1a (100 mg, 0.27 mmol), Ag₂O (34 mg, 0.15 mmol), [Ir(Cp*)Cl₂]₂ (120 mg, 0.15 mmol) and anhydrous CH_2Cl_2 (5 mL) along with some 4Å molecular sieves. The reaction was heated at 40°C for 16 hours, filtered through a 2 cm silica plug and flushed with CH_2Cl_2 (3 × 10 mL). The solvent was removed from the filtrate in vacuo and the solid added to Et₂O (10 mL). This was filtered and removal of the solvent from the filtrate in vacuo gave 3a as an orange powder. Yield: 63 mg, 0.10 mmol (37 %). ¹H NMR (300 MHz, CD₂Cl₂): δ 6.87 (d, J = 3.0 Hz, 1H, NCH), 6.80 (d, J = 3.0 Hz, 1H, NCH), 4.56 (td, J = 12.0 Hz, 6.0 Hz, 1H, CH₂), 4.13 (br. s, 1H, carboranyl CH), 3.95 (m, 1H, CH₂), 3.06 (d, J = 12.0 Hz, 1H, CH₂-Ir), 2.98 (m, 1H, CH_2), 2.63 (m, 1H, CH_2), 2.39 (d, J = 12.0 Hz, 1H, CH₂-Ir), 1.78/1.74 (Cp*), 1.53 (s, 3H, CH₃), 1.15 (s, 3H, CH₃). 13 C{¹H} NMR (75 MHz, CDCl₃): δ 164.0 (NCN), 119.7 (NCH), 117.3 (NCH), 89.7/89.4 (quaternary Cp*), 73.0 (carboranyl quaternary C), 65.9 (CH₃), 62.7 (carboranyl CH), 49.3 (CH₂), 39.7 (CH₂), 31.4/31.0 (CH₃), 28.3 (Ir-CH₂), 10.1/10.0 (Cp*). $^{11}\text{B}\{^{1}\text{H}\}$ NMR (96 MHz, CDCl_3): δ -2.3, -5.4, -9.5, -11.1, -12.6. HRMS (ESI+): $m/z [C_{21}H_{40}B_{10}N_2Ir]^+$ 621.3803, Calcd for [M-CI]⁺ 621.3811. Anal. Calcd for $C_{22}H_{42}B_{10}CIN_2Ir$: C, 38.43; H, 6.14; N, 4.27. Found: C, 38.50; H, 6.21; N, 4.35.

Ir complex 4a

To a Schlenk flask was added **1a** (100 mg, 0.27 mmol), Ag_2O (94 mg, 0.41 mmol), $[Ir(Cp^*)Cl_2]_2$ (108 mg, 0.14 mmol) and anhydrous MeCN (5 mL) along with some 4Å molecular sieves. The reaction was heated at 70°C for 24 hours, filtered through a 2 cm silica plug and flushed with MeCN (3 × 10 mL). The solvent volume was reduced to 5 mL *in vacuo* resulting in **4a** as

colourless crystals, which were filtered, washed with pentane (5 mL) and dried in vacuo. Yield: 41 mg, 0.06 mmol (22 %). $^1\mathrm{H}$ NMR (500 MHz, C_6D_6): Major isomer (70 %) δ 6.11 (d, 1H, J = 2.0 Hz, NCH), 5.96 (d, J = 2.0 Hz, 1H, NCH), 4.06 (td, J = 13.1 Hz, 3.0 Hz, 1H, CH₂), 3.24 (d, J = 10.0 Hz, 1H, CH₂-Ir), 3.21 (br. s, 1H, carboranyl CH), 2.64 (m, 2H, CH₂), 2.63 (d, J = 10.0 Hz, 1H, CH₂-Ir), 1.87 (m, 1H, CH₂), 1.61 (Cp*), 1.44 (s, 1H, CH₃), 1.06 (s, 1H, CH₃). Minor isomer (30 %) δ 5.86 (d, 1H, J = 2.0 Hz, NCH), 5.74 (d, 1H, J = 2.0 Hz, NCH), 4.35 (td, J = 13.8 Hz, 3.0 Hz, 1H, CH₂), 3.07 (d, J = 10.5 Hz, 1H, CH₂-Ir), 3.21 (br. s, 1H, carboranyl CH), 2.64 (m, 2H, CH₂), 2.63 (d, J = 10.5 Hz, 1H, CH₂-Ir), 2.18 (m, 1H, CH₂), 1.98 (m, 1H, CH₂), 1.73 (Cp*), 1.26 (s, 1H, CH₃), 0.98 (s, 1H, CH₃). ¹³C{¹H} NMR (75 MHz, C₆D₆): δ 117.6/117.5 (NCH), 116.7/116.6 (NCH), 93.5/93.0 (quaternary Cp*), 65.8/65.5 (carboranyl quaternary C), 59.9/58.3 (carboranyl CH), 45.1/44.3 (CH₂), 41.3 (CH₂), 31.9/31.2 (CH₃), 30.7/30.5 (CH₃), 20.6/18.4 (Ir-CH₂), 9.7/9.7 (Cp*). ¹¹B{¹H} NMR (96 MHz, C₆D₆): δ -1.4, -4.0, -7.8, -11.3, -15.3. HRMS (ESI+): $m/z \left[C_{21}H_{39}B_{10}N_2Ir\right]^+$ 620.3766, Calcd for $\left[\mathsf{M}\right]^{+}$ 620.3733. Anal. Calcd. for $C_{21}H_{39}B_{10}N_2Ir$: C, 40.69; H, 6.34; N, 4.52. Found: C, 40.80; H, 6.47; N, 4.30. Crystals suitable for X-ray diffraction analysis were grown by the slow evaporation of a concentrated solution of **4a** in MeCN.

Ir complex 2b

To a Schlenk flask was added 1b (50 mg, 0.15 mmol), Ag₂O (17 mg, 0.075 mmol), $[Ir(Cp^*)Cl_2]_2$ (60 mg, 0.073 mmol) and anhydrous CH₂Cl₂ (5 mL), along with some 4 Å molecular sieves. The reaction was heated at 40°C for 16 hours, filtered through celite and flushed with CH_2Cl_2 (3 × 5 mL). The solvent was removed from the filtrate in vacuo and the residue was recrystallised from acetone (5 mL) / pentane (30 mL), filtered and dried in vacuo to give 2b as a yellow solid. Yield: 86 mg, 0.13 mmol (89 %). ¹H NMR (300 MHz, CDCl₂): δ 6.97 (d, J = 3.0 Hz, 1H, NCH), 6.90 (d, J = 3.0 Hz, 1H, NCH), 4.94 (m, 1H, CH₂), 4.45 (br. s, 1H, carboranyl CH), 3.97/3.95 (s, 3H, CH₃), 3.71 (m, 1H, CH₂), 3.21 (m, 1H, CH₂), 2.59 (m, 1H, CH₂), 1.64/1.61 (s, 15H, Cp*). ¹³C{¹H} NMR (75 MHz, CDCl₃): δ 158.2 (N*C*N), 124.3 (NCH), 121.3 (NCH), 89.2 (quaternary Cp*), 71.9 (carboranyl quaternary C), 60.9 (carboranyl CH), 49.7 (CH₂), 39.1 (CH₂), 38.8 (CH₃), 9.5/9.3 (Cp*). ¹¹B{¹H} NMR (96 MHz, CDCl3): δ -2.2, -5.0, -9.6, -13.0. HRMS (ESI+): *m/z* [C₁₈H₃₅B₁₀N₂IrCl]⁺ 615.3121, Calcd for $[M-Cl]^+$ 615.3106. Anal. Calcd for $C_{18}H_{35}B_{10}N_2IrCl_2$: C, 33.22; H, 5.42; N, 4.31. Found: C, 33.12; H, 5.34; N, 4.37. Crystals suitable for X-ray diffraction analysis were grown by the slow diffusion of hexane into a concentrated solution of 2b in CH₂Cl₂.

Rh complex 5b

To a Schlenk flask was added **1b** (50 mg, 0.15 mmol), Ag₂O (17 mg, 0.075 mmol), [Rh(Cp^{*})Cl₂]₂ (46 mg, 0.074 mmol) and anhydrous CH₂Cl₂ (5 mL), along with some 4 Å molecular sieves. The reaction was heated at 40°C for 16 hours, filtered through celite and flushed with CH₂Cl₂ (3 × 5 mL). The solvent was removed from the filtrate *in vacuo* and the residue was recrystallised from acetone (5 mL) / pentane (30 mL), filtered and dried *in vacuo* to give **5b** as a yellow solid. Yield: 79 mg,

Ru complex 6b

To a Schlenk flask was added 2b (50 mg, 0.15 mmol), Ag₂O (17 mg, 0.075 mmol), [Ru(p-cymene)Cl₂]₂ (46 mg, 0.075 mmol) and anhydrous CH_2Cl_2 (5 mL), along with some 4 Å molecular sieves. The reaction was heated at 40°C for 3 hours, filtered through celite and flushed with CH_2Cl_2 (3 × 5 mL). The solvent was removed from the filtrate in vacuo and the residue subjected to column chromatography on silica using a gradient elution with CH₂Cl₂ / MeOH (2%). Recrystallisation from MeCN gave 6b as a microcrystalline orange solid. Yield: 58 mg, 0.10 mmol (67 %). ¹H NMR (500 MHz, CD_2CI_2): Major δ 7.08 (d, J = 2.0 Hz, 1H, NCH), 7.03 (d, J = 2.0 Hz, 1H, NCH), 5.40 (d, J = 5.0 Hz, 2H, p-cymene Ar-H), 5.06 (d, J = 5.0 Hz, 2H, p-cymene Ar-H), 4.93 (br. s, 1H, CH₂), 4.54 (br. s, 1H, carboranyl CH), 3.94 (s, 3H, CH₃), 3.82 (br. s, 1H, CH₂), 2.93 (br. s, 1H, CH₂), 2.90 (septet, J = 10 Hz, 1H, isopropyl-CH), 2.64 (br. s, 1H, CH₂), 1.93 (s, 3H, CH_3), 1.26 (d, J = 10 Hz, 6H, CH_3). ¹³C{¹H} NMR (126 MHz, CD_2Cl_2): δ 175.6 (NCN), 125.3 (NCH), 122.0 (NCH), 110.4 (p-cymene quaternary C), 99.4 (p-cymene quaternary C), 86.4 (p-cymene CH), 82.4 (p-cymene CH), 72.6 (carboranyl quaternary C), 61.5 (carboranyl CH), 50.5 (CH₂), 39.9 (CH₃), 39.0 (CH₂), 31.2 (p-cymene isopropyl-CH), 23.0 (p-cymene CH₃), 21.9 (*p*-cymene CH₃), 18.8 (*p*-cymene CH₃). ${}^{11}B{}^{1}H{}$ NMR (161 MHz, CDCl₃): δ -2.4, -5.4, -9.8, -12.9. HRMS (ESI+): m/z $[C_{18}H_{34}B_{10}N_2RuCl]^+$ 523.2460, Calcd for $[M-Cl]^+$ 523.2455. Anal. Calcd for C₁₈H₃₄B₁₀N₂RuCl₂: C, 38.71; H, 6.14; N, 5.02. Found: C, 38.63; H, 6.02; N, 5.12. Crystals suitable for X-ray diffraction analysis were grown by the slow evaporation of a concentrated solution of 6b in MeCN.

Ir complex 7b/8b mixture

To a Schlenk flask was added **2b** (100 mg, 0.15 mmol), Ag₂O (52 mg, 0.22 mmol) and anhydrous MeCN (5 mL) along with some 4Å molecular sieves. The reaction was heated at 70°C for 16 hours, filtered through a 2 cm silica plug and flushed with MeCN (2 × 10 mL). The solvent was reduced to 5 mL and the desired product was precipitated with Et₂O (30 mL), filtered and the solvent removed *in vacuo* to give a mixture of **7b** and **8b**. Yield: 52 mg, 0.08 mmol (53 %). The NMR spectra contain several sets of overlapping resonances (see Supporting Information) hence are not interpreted here. HRMS (ESI+): m/z [C₁₈H₃₄B₁₀N₂Ir]⁺ 579.3350, Calcd for [M-CI]⁺ 579.3340. Anal. Calcd for C₁₈H₃₄B₁₀N₂IrCl: C, 35.20; H, 5.58; N, 4.56. Found: C, 35.34; H, 5.57; N, 4.63.

Ir complex 7b

To a Schlenk flask was added 1b (50 mg, 0.15 mmol) and anhydrous THF (5 mL). The solution was cooled to -78 °C and a 1.6 M solution of ⁿBuLi in hexane (133 µL, 0.32 mmol) was added dropwise. This was stirred at -78 °C for 30 minutes, then the temperature was then raised to 0 °C and stirred for a further 1 hour. A solution of [IrCp*Cl₂]₂ in THF (3 mL) was added at 0°C and the reaction was stirred at room temperature for 12 hours. The solvent was removed in vacuo, CH₂Cl₂ (5 mL) added and filtered through a 2 cm silica plug which was flushed with CH_2Cl_2 (2 × 10 mL). The solvent volume was reduced to 5 mL and the product precipitated with pentane (30 mL), filtered and dried in vacuo to give 7b as a yellow solid. Yield: 68 mg, 0.11 mmol (73 %). ¹H NMR (300 MHz, CD₂Cl₂): δ 6.97 (m, 1H, NCH), 6.90 (s, 1H, NCH), 4.54 (m, 1H, CH₂), 3.98/3.94 (s, 3H, CH₃), 3.72 (m, 1H, CH₂), 2.82 (m, 1H, CH₂), 2.66 (m, 1H, CH₂), 1.53/1.48 (Cp*). ¹³C{¹H} NMR (75 MHz, CD_2Cl_2): δ carbenic C not observed, 126.0/125.9 (NCH), 121.2 (NCH), 93.8/93.5 (quaternary Cp*), 46.2 (CH₂), 42.3, 41.0, 39.2 (CH_3) , 9.6/9.3 (Cp*). HRMS (ESI+): $m/z [C_{22}H_{29}B_{10}N_2Ir]^+$ 549.1650, Calcd for [M-X]⁺ 549.1635. Crystals suitable for X-ray diffraction analysis were grown by the slow evaporation of a concentrated solution of 7b in MeCN.

Ir complex 2c

2c was prepared as described for **2b**, starting from **1c** (50 mg, 0.14 mmol), Ag₂O (16 mg, 0.07 mmol), $[Ir(Cp^*)Cl_2]_2$ (56 mg, 0.07 mmol) and anhydrous CH₂Cl₂ (5 mL). After purification the product was obtained as a yellow solid. Yield: 80 mg, 0.12 mmol (86 %). ¹H NMR (300 MHz, CDCl₃): δ 6.99 (d, J = 2.1 Hz, NCH), 6.92 (d, J = 2.1 Hz, NCH), 5.04 (m, 1H, CH₂), 3.99/3.97 (s, 3H, CH₃), 3.84 (td, J = 12.0 Hz, 3 Hz, 1H, CH₂), 3.41 (m, 1H, CH₂), 2.48 (m, 1H, CH₂), 2.15 (s, 3H, CH₃), 1.67/1.63 (Cp^{*}). ¹³C{¹H} NMR (75 MHz, CDCl₃): δ 158.6 (NCN), 121.3 (NCH), 89.4/89.1 (quaternary Cp^{*}), 74.9 (carboranyl quaternary C) (only one carboranyl quaternary C observed), 49.9 (CH₂), 38.9 (CH₃), 36.6 (CH₂), 23.9 (carboranyl CH₃), 9.5/9.3 (Cp^{*}). ¹¹B{¹H} NMR (96 MHz, CDCl₃): δ -3.7, -6.1, -10.0. HRMS (ESI+): *m/z* [C₁₉H₃₇B₁₀N₂IrCl]⁺ 629.3283, Calcd for [M-Cl]⁺ 629.3263.

Ir complex 8c

This complex was prepared as described for **7b/8b**, starting from **2c** (60 mg, 0.09 mmol), Ag₂O (16 mg, 0.07 mmol) and anhydrous MeCN (5 mL). After purification **8c** was obtained as a yellow solid. Yield, 25 mg, 0.04 mmol (44 %). ¹H NMR (500 MHz, CD₃CN): δ 7.23 (d, J = 2.0 Hz, 1H, NCH), 7.19 (d, J = 2.0 Hz, 1H, NCH), 7.19 (d, J = 2.0 Hz, 1H, NCH), 7.11 (d, J = 2.0 Hz, 1H, NCH), 5.01 (td, J = 12.5 Hz, 6 Hz, 1H, CH₂), 4.25 (m, 1H, CH₂), 4.02-3.95 (m, 1H, CH₂), 2.30 (m, 1H, CH₂), 2.17 (s, 1H, CH₃), 1.72/1.68/1.63 (Cp*). ¹³C{¹H} NMR (126 MHz, CD₃CN): δ 124.4 (NCH), 122.8 (NCH), 95.5/89.6 (quaternary Cp*), 50.5 (CH₂), 37.9, (CH₂), 36.9 (CH₃), 23.9 (CH₃), 9.3, 9.2, 9.0, 8.8. ¹¹B{¹H} NMR (161 MHz, CD₃CN): δ -4.2, -6.3, -8.5, -9.8, -10.6. HRMS (ESI+): m/z [C₁₉H₃₆B₁₀O₂|r]⁺ 593.3513, Calcd for [M-Cl]⁺

Ir complex 2d

To a Schlenk flask was added 1d (50 mg, 0.19 mmol), Ag₂O (22 mg, 0.095 mmol), [Ir(Cp*)Cl₂]₂ (76 mg, 0.095 mmol) and anhydrous CH_2Cl_2 (5 mL) along with some 4Å molecular sieves. The reaction was heated at 40°C for 16 hours and filtered over celite, which was flushed with CH_2CI_2 (3 × 5 mL). The solvent was removed from the filtrate in vacuo and the residue was recrystallised from acetone (5 mL) with pentane (30 mL), filtered and dried in vacuo to give 2d as a yellow solid. Yield: 97 mg, 0.17 mmol (89 %). ¹H NMR (300 MHz, CDCl₃): δ 7.47-7.20 (m, 5H, benzyl), 6.95-6.89 (m, 2H, NCH), 5.08 (dt, J = 12.0, 6.0 Hz, 1H, CH₂), 4.00/3.98 (s, 3H, CH₃) 3.89 (dt, J = 12.0, 6.0 Hz, 1H, CH₂), 3.50 (dt, J = 12.0, 6.0 Hz, 1H, CH₂) 2.99 (dt, J = 12.0, 6.0 Hz, 1H, CH₂), 1.62/1.59 (s, 15H, Cp*). ¹³C{¹H} NMR (75 MHz, CDCl₃): δ 157.0 (NCN) 138.7 (benzyl), 129.4 (benzyl), 128.7 (benzyl), 126.7 (benzyl), 123.5 (NCH), 121.5 (NCH), 88.8 (quaternary Cp*), 52.2 (CH₂), 38.7 (CH₃), 38.4 (CH₂), 9.5/9.3 (Cp*). Catalytic transfer hydrogenation general procedure

Catalyst (0.01 or 0.005 mmol) and 1,3,5-trimethoxybenzene 15 (55.5 mg, 0.33 mmol) were added to an ampoule and degassed. In a Glovebox, ^tBuOK (14 mg, 0.1 mmol) and 16 acetophenone (117 μ L, 1 mmol) were added to the ampoule. Under an atmosphere of N₂, anhydrous [']PrOH (2.30 mL, 30 mmol) was added and the reaction was heated at 82 °C for 1 17 hour. The reaction mixture was quenched by cooling in an ice bath and an aliquot (0.1 mL) was added to an NMR tube with CDCl₃ (0.4 mL). Conversion was calculated using ¹H NMR 18 spectroscopy by comparing the integration of the methyl resonance of 1-phenylethanol with the internal standard, and values are an average of two separate runs.

Acknowledgements

The EPSRC and the University of Leeds are acknowledged for funding. We would like to thank Mr Stephen Boyer (London Metropolitan University) for the elemental analysis data, and Mr Simon Barrett (University of Leeds) for the VT NMR data.

Chelating N-heterocyclic carbene-carboranes offer flexible ligand

coordination to Ir^{III}, Rh^{III} and Ru^{II}: effect of ligand cyclometallation in

catalytic transfer hydrogenation

Jordan Holmes, Christopher M. Pask and Charlotte E. Willans*

NHC-carborane ligands, with flexible coordination through either the carbon or the boron atom of the carborane, provide effective transfer hydrogenation catalysts.
