Keywords Gold / Aziridines / Indoles / Tryptamines/ Pyrroloindolines

Abstract
A study on the S_N2-type ring opening reactions of aziridines with indoles as nucleophiles is reported. Under gold(I) catalysis a great variety of tryptamine derivatives were prepared in good to excellent yields with complete stereocontrol when chiral aziridines were used. We demonstrated that cationic gold(I) catalysts are superior Lewis acids to the previously reported group 3, 12 and 13 metals in term of catalyst loading and reaction yields. Moreover, complete regioselectivity was observed for 2-phenyl-N-tosylaziridine; whereas, regioselectivity up to 10:1 ratio was observed with 2-methyl-N-tosylaziridine. Finally, a preliminary study on the dearomatization reactions giving rise to pyrroloindolines is also reported.

Introduction
Aziridine nucleophilic ring-opening reactions have been recognized for a long time as a precious and reliable tool to introduce the CCN motif in a huge number of substrates.¹ In the specific case of the indole nucleus, regioselective nucleophilic ring-opening of aziridines led to the formation of tryptamine derivatives, chemical synthesized or naturally occurring drugs/alkaloids with well-defined and significant biological effects.² However, reported examples with indoles as nucleophiles are relatively rare and involve aziridines bearing an electron withdrawing group at nitrogen (activated aziridines) under (Lewis) acidic catalysis.³ In particular, the regiochemical outcome for those reactions involving C2 monosubstituted aziridines largely depends on the substitution pattern (Scheme 1).
Scheme 1 Previously reported results on the ring opening reactions of aziridines with indoles.

For example, indoles add regioselectively at the benzylic position of C2 aryl substituted aziridines under LiClO$_4$ $^{3b}$ and Sc(OTf)$_3$/Zn(OTf)$_2$ catalysis, $^{3d}$ or in the presence of an excess of BF$_3$ $^{3i}$ (Scheme 1, eq. 1). Moving to alkyl substituted aziridines, mixtures of both conceivable regioisomers are isolated using Zn(OTf)$_2$ $^{3c}$ as catalyst, and only one report of regioselective reaction in the presence of an excess of BF$_3$ has been reported till now $^{3i}$ (Scheme 1, eq. 2). Besides, aziridines 2-carboxylate have been involved in the synthesis of tryptophan derivatives using 1 equivalent of Sc(ClO$_4$)$_3$, $^{3j}$ Sc(OTf)$_3$ $^{3b}$ or Y(OTf)$_3$ $^{3d}$ as promoters (Scheme 1, eq. 3). From data reported in scheme 1, it should be noted that working with chiral C2 substituted aziridines, enantiomeric pure compounds can be obtained, suggesting the involvement of a $S_N$2-type mechanism for the ring-openning reaction. $^{3i,3c}$ Clearly, enantiomeric pure derivatives have been obtained in C3 selective ring opening reactions of enantiomeric pure C2 substituted aziridines. $^{3b,3d,3j}$ Furthermore, several of the reported reactions suffers from some drawbacks, i.e., they are performed in the presence of at least stoichiometric amount of Lewis acids, require an excess of aziridine/indole substrates and/or are limited in scope.

On the other hand, indole is one of the most extensively explored heterocyclic nucleus. A plethora of synthetic methodologies have been developed for the assembly of the indole core $^4$ as well as for the functionalization of the preformed nucleus. $^5$ This latter goal has been mainly achieved on the pyrrole moiety with electrophiles, exploiting the enamine-type reactivity at the C3 carbon atom and the nucleophilic properties of the nitrogen atom, and, to a lesser extent, with nucleophiles, reversing the natural reactivity by the insertion of proper substituents at nitrogen or at C2/C3 positions.

Others interconnected and fascinating research areas encompass the dearomative manipulation of the preformed indole ring $^6$ for the synthesis of the indolenine core and the cyclization/cycloaddition reactions for the synthesis of polycyclic indole derivatives, $^4c,4h,4k,7$ either common scaffolds in naturally occurring and bioactive compounds. Over the last years, the effectiveness of all these transformations has been notably enhanced through the development of new catalytic and organocatalytic processes.

Considering these results and in step with our latest research reports on the synthesis of polycyclic indoles $^8$ and indole derivatives $^9$ under gold catalysis, we recognized gold-activated aziridines as
suitable electrophiles for the simple functionalization and the dearomative reactions of indoles for the synthesis of \( \beta \)-indolylamines and fused pyrrolo[2,3-\(b \)]indoles, respectively (Scheme 2).

**Scheme 2** Planned gold(I) catalyzed reactions.

Formation of stable complexes via \( N \)-coordination of aziridines with \textit{in situ} generated triphenylphosphine gold(I) triflate (AuPPh\(_3\)OTf) has been recently described by Lorenz and co-workers.\(^{10}\) These complexes are quite stable and can be isolated and characterized under standard laboratory conditions. Moreover, in 2007 Wu and co-workers published a gold(III) chloride/silver triflate catalyzed ring-opening reaction of aziridines with furan and electron-rich arenes.\(^{11}\) Thus, in the presence of 1-5% of AuCl\(_3\) and 3-15% of AgOTf in nitromethane at room temperature, the reaction affords the corresponding \( \beta \)-aryl(furyl)amines in good to excellent yields. Moreover, several papers dealing with the \( \sigma \)-phylic properties of gold species have been recently published.\(^{8a,12}\)

**Results**

We started our investigations testing the reactivity of indoles 1\( \text{a} \) and 1\( \text{h} \) with racemic 2-phenyl-\( N \)-tosylaziridine (2\( \text{a} \)), under conventional Lewis acid, organic acid and under gold catalysis. A comprehensive review of reaction conditions we tested is summarized in Table 1.

**Table 1.** Optimization studies for the formation of tryptamine derivatives 3\( \text{a} \) and 3\( \text{h} \).

Entries 1-3, 5-14: reaction conditions: to a solution of indole (0.3 mmol) and aziridine (n equiv.) in the appropriate solvent (2 mL, 0.15 M), catalyst was added and the mixture was stirred for the stated time and temperature. Entry 4, see ref. 3i.

We choose to survey the reactivity of 2-alkynylindole 1h, beside simple and commercially available 1a, to verify the feasibility of a domino process involving nucleophilic addition of indole to aziridine and subsequent hydroamination of the triple bond (Table 1, compound in brackets). However, under tested reaction conditions, this compound has been never isolated or detected in the crude reaction mixtures. When the reaction works toward the formation of the desired compounds 3 the only isolated regioisomers arose from the C2 selective ring-opening of the aziridine, compounds 3a and 3h. The structure of 3a was elucidated via 1D and 2D NMR experiments. Initially, for comparison, we tested several conventional Lewis acids under catalytic condition (15 mol%, entries 103). Instead, boron trifluoride was used under the conditions reported in ref. 3i (entry 4). These first attempts, however, led to the formation of the desired product in poor or moderate yields. Similar results were obtained in the presence of trifluoroacetic acid as catalyst, whereas the phosphoric acid (1,1’-binaphthyl-2,2’-diyl hydrogenphosphate) resulted essentially ineffective, entries 5-6. Thus, gold(III) chloride, in the presence of silver triflate as activating agent, was tested under the reaction conditions reported by Wu, entry 7. In this case, 3a was obtained in 23% yield. 5 mol% silver triflate, silver triflimidate or cationic gold(I) species resulted more effective, entries 8-14, and compounds 3a or 3h were isolated in 45-98% yields, with [Au(JohnPhos)NTf₂] as catalyst of choice.

With these results in hand, we initially choose to test the scope of the reaction under the conditions reported in table 1, entry 14, changing the substituents array on the indole nucleus (Scheme 3).
Scheme 3 Reaction scope with 2-phenyl-N-tosylaziridines 2a and (R)2a.

Product yields ranged from very good to excellent when the reaction was performed with 2-aryl, 2-alkyl, 2-vinyl, 2-alkynyl and 2-allyl indoles (1a, 1c-f, 1h-j), with N-Me protected indoles 1b and 1g and with indole itself (1k). The introduction of an EWG on the indole phenyl moiety is well tolerated (1l), whereas in the presence of an EDG, indole 1m, or of when an ethoxycarbonyl group is linked at C2 of the indole nucleus, indoles 1n and 1o, the corresponding tryptamine derivatives 3m-o were obtained in moderate yields. Moreover, the reactions of indoles 1a,c-e,k were repeated in the presence of (R)-2-phenyl-N-tosylaziridine ((R)2a) yielding the corresponding optical active compounds (S)3a,c-e,k in enantiomeric excesses comparable to that of the starting aziridine.

Next, we turned our attention to the aziridine nucleus testing the reactivity of N-tosylaziridine (2b) (Scheme 4).
The reaction works well also with the unsubstituted $N$-tosylaziridine (2b). Tryptamines 3p-t were obtained in 62-71% yield using a slight excess (1.2 equivalents) of thermally fragile 2b. Working with a larger excess of 2b (1.5 or 2.0 equivalents) resulted in the isolation of dirty reaction products, contaminated by inseparable tarry decomposition compounds arising from 2b.

Then, we focused on the ring opening reactions of racemic 2-methyl-$N$-tosylaziridine (2c) with indoles 1 (Table 2).

**Table 2.** Ring-opening reactions of 2-methyl-$N$-tosylaziridine (2c) with indoles 1.

Generally, quite unsatisfactory results were obtained working with 2-methyl-N-tosylaziridine 2c. The first three experiments (entries 1-3), performed with indoles 1a,c,e under standard reaction conditions, resulted in the isolation in excellent overall yields of an inseparable mixture of both conceivable regioisomeric tryptamines 3u-w and 3'u-w in 2:1 ratios. As reported in the introduction, regioselectivity in the ring-opening reaction of activated 2-alkylaziridines, using indoles as nucleophiles, is still a challenging objective and only one example of a regioselective reaction has been reported till now in the presence of an excess (1.5 equiv.) of boron trifluoride etherate.\(^{31}\) Thus, we performed the reaction between 1a and 2c under the conditions reported by Farr and co-workers (entry 4) attaining 3u and 3'u in 12:1 ratio. Next, with the aim to improve the regioisomeric ratios between 3 and 3' under catalytic conditions, we tested several cationic gold(I) complexes varying both the ligands and the counterions (entries 5-8) achieving quite disappointing results. Better results could be obtained in the presence of simple gold(I) salts such as gold(I) triflate, generated in situ by mixing equimolecular amounts of gold(I) chloride and silver triflate. Thus, the reaction gave rise to compounds 3u and 3'u in 7:1 ratio (entry 9). Yield and regioisomeric ratio comparable to those obtained with boron trifluoride could be obtained working in the presence of 2 equivalents of indole 1a (entry 10). A brief screening on the silver salts nature was then performed revealing that AuCl/AgSbF\(_6\) and AuCl/AgNTf\(_2\) were the catalysts of choice to achieve 3u and 3'u in 70% yield and 7:1 ratio (entries 11-12). A control experiment performed with silver triflate as catalyst failed to give the desired compound (entry 13). Structures and ratios between the two regioisomers were assigned via NMR analysis.\(^{13}\) A control reaction between indole 1a and aziridine (S)2c under the reaction conditions reported in table 2, entry 12 resulted in the isolation of a mixture of (R)3u (94% ee) and 3'u in 68% overall yield (10:1 ratio) (Scheme 5).

Scheme 5 Gold(I) catalyzed reaction of indole 1a and aziridine (S)2c.

Moreover, several additional experiments were performed with indole 1a and aziridines 2d-f (Scheme 6).
Scheme 6 Gold(I) catalyzed reaction of indole 1a and aziridines 2d-f.

Under standard reaction conditions indole 1a reacts with aziridines 2d and 2e giving rise to tryptamines 3x-y in low to moderate yields, beside unreacted 1a. Moreover, the same reaction performed in the presence of aziridine 2f resulted in the isolation of unreacted 1a (45%) alongside a mixture of unidentified compounds.

Finally, we want to report our preliminary results on the dearomative domino addition/annulation reactions between N3-dimethylindole 1p, N-benzyl-3-methylindole 1q, 2,3-dimethylindole 1r and 3-allyl-N-methylindole 1s with aziridines 2a and 2b, under cationic [Au(JohnPhos)(NTf2)] gold(I) catalysis (Scheme 7).

Excellent results on related dearomative reactions, involving unsubstituted aziridine, \(^{14}\) symmetrically C2/C3 substituted aziridines \(^{15}\) or C2 substituted aziridines \(^{16}\), have been recently reported.

\(^{*}\) Under microwaves irradiation.
Scheme 7 Dearomative domino addition/annulation reactions.

Under cationic gold(I) catalysis, the dearomatization reactions of indoles 1p-r with aziridine 2a proceeded in moderate yields giving rise to the corresponding diastereoisomeric dihydropyrroloindolines (±)4a-c and (±)4’a-c as racemic mixtures. Diastereoisomers (±)4a/(±)4’a and (±)4c/(±)4’c could be separated by column chromatography and the structures established by comparison with reported data for (±)4a and (±)4’a and by 2D NOESY experiments for (±)4c and (±)4’c. Diastereoisomers (±)4b/(±)4’b were characterized as a mixture via NMR and by comparison with reported data. Reactions with indoles 1p-q were repeated also in the presence of chiral aziridine (R)2a giving rise to enantiomeric enriched diastereoisomers 4a (96% ee) and 4’a (96% ee) / 4b (99% ee) and 4’b (99% ee). 4a/4’a and 4b/4’b were evaluated as mixtures via chiral HPLC analysis, after chromatographic purification.

Working with indole 1p and aziridine 2b, the indoline 4d was obtained in 55% yield after optimization of the reaction conditions. In particular, the reactions performed under standard conditions (ratio indole/aziridine 1:1.2, 0.15 M solution in dichloroethane) at 80 and at 120°C under conventional heating or at temperatures ranging from 120 to 150 °C under microwaves irradiation gave unsatisfactory results (yields 18-39%, scheme 7, entries 1-4). A brief optimization study on the reagents ratios and reaction concentration revealed that doubling the equivalents of 2b has no effect on the product yield (scheme 7, entry 5). On the other hand, working with two equivalents of indole 1p, at 0.3 M and 0.6 M concentrations, the desired compound could be isolated in 45% and 55% yields, respectively (scheme 7, entries 6-7). Under optimized reaction conditions, 3-allyl-N-methylindole (1s) was tested in the dearomative reaction giving rise to indoline 4e in 45% yield.

Discussion

As a general remark it can be stated that cationic gold(I) complexes are active catalysts in the ring-opening reactions of activated aziridine with indoles as nucleophiles. In particular, [Au(JohnPhos)NTf2] is the catalyst of choice for the ring-opening reactions performed with 2-phenyl-N-tosylaziridine 2a. Thus, the nucleophilic attack of indoles 1a-o, through C3 carbon atom, occurs regioselectively at the C2 of the aziridine ring, yielding the corresponding tryptamine derivatives 3a-o in excellent yields with a catalyst loading of only 5 mol%. Moreover, the ring-opening reactions provide racemic mixtures when performed with achiral aziridine 2a and is stereospecific employing the chiral aziridine (R)2a as starting material. Based on these experimental results and literature reports, a reaction mechanism can be postulated for the ring-opening reactions of 2a and (R)2a with indoles 1 (Scheme 8). Therefore, azaphilic activation of aziridine by cationic gold(I) catalyst produces an activated complex (I). Then the indole 1 attacks regioselectively at the benzylic carbon of I producing a new intermediate II via a Friedel-Craft-type reaction. Rearomatization and protodeauration steps conclude the catalytic cycle affording 3 and restoring the catalyst.
The stereospecificity attained with \((R)2a\) accounts for the intermediacy of a strongly polarized specie like \(I\), reacting with \(1\) via \(S_N2\)-type mechanism. Besides, the intermediacy of a zwitterionic specie \(III\), scheme 7, can be disregarded as it would provide racemic \(3\) by \(S_N1\)-type mechanism. Unfortunately, the same regioselectivity was not observed in the ring-opening reactions involving 2-methyl-N-tosylaziridine (2b) under \([Au(JohnPhos)\text{NTf}_2]\) catalysis. As reported in the literature and confirmed by our experiments (see Table 2), boron trifluoride is able to almost regioselectively address the nucleophilic attack at the more hindered carbon atom of the aziridine ring. It seems that an excess of a hard Lewis acid like boron trifluoride is essential to establish a strong interaction within both reacting substrates and to trigger the reaction toward the \(C2\) selective ring-opening reaction path.\(^{31,19}\) Instead, cationic gold(I) complexes in catalytic amount weakly interacts with the aziridine nitrogen and, in the absence of a strong directing group like a phenyl ring in aziridine 2a, the reaction outcomes is driven by steric and electronic issues making possible two opposite reaction paths. Both of them involve ring-opening reaction of the aziridine 2b, respectively at \(C2\) and \(C3\), affording mixtures of both conceivable tryptamines 3 and \(3'\). In line with these observations, it is worth to note that using 5 mol% of more electrophilic naked cationic gold salts improve the regioisomeric ratio between 3u and \(3'u\). Importantly, \([Au(JohnPhos)\text{NTf}_2]\) catalyst results effective also in the dearomative reactions of \(C3\) substituted indoles. In this latter case, a reaction intermediate analogous to \(II\), scheme 8, evolves by intramolecular amination reaction and regeneration of the catalyst.

**Conclusions**

In this work we established the high efficiency of cationic gold(I) catalyst \([Au(JohnPhos)(\text{NTf}_2)]\) in the ring opening reactions of 2-phenyl-N-tosylaziridine 2a and \((R)2a\) with indoles as nucleophiles. In particular, we gathered a large collection of tryptamine derivatives in high yields, with complete stereochemical control and at a catalyst loading of only 5 mol%. To the best of our
knowledge, only sporadic examples of related Lewis acid catalyzed reactions have been reported till now.\textsuperscript{3h,3a,3i} Furthermore, it should be pointed out that, depending on the nature of the Lewis acid employed, previously reported reactions could suffer from lack of stereocontrol due to racemization of the starting aziridine during the reaction course.\textsuperscript{16a} The results obtained with 2a, beside those obtained with N-tosylaziridine itself (2b), represent the key strength of our work. In contrast, less exciting results have been achieved with 2-methyl-N-tosylaziridine (2c) and in the dearomative domino addition/annulation reactions. In the first case, we observed a lack of regiochemical control even if nearly quantitative reaction yields could be obtained. Dearomative reactions giving rise to pyrroloindoline derivatives, beside excellent stereocontrol, present several drawbacks. Moderate yields and low diastereoselection are the main weak points that must be addressed and further efforts in these directions are ongoing in our laboratory. Also the results reported for aziridines 2d-f in scheme 6 could represent a good starting point for further investigations.

**Experimental**

**General Experimental Details**

All chemicals and solvents are commercially available and were used after distillation or treatment with drying agents. Silica gel F254 thin-layer plates were employed for thin-layer chromatography (TLC). Silica gel 40–63 micron/60 Å was employed for flash column chromatography. Melting points were measured with a Perkin-Elmer DSC 6 calorimeter at a heating rate of 5 °C/min and are uncorrected.\textsuperscript{1}H and \textsuperscript{13}C-NMR spectra were determined with a Varian-Gemini 200, a Bruker 300 or 500 Avance spectrometers at room temperature in CDCl\textsubscript{3}, CD\textsubscript{2}Cl\textsubscript{2} or d\textsubscript{6}-acetone with residual solvent peaks as the internal reference. The APT sequence was used to distinguish the methine and methyl carbon signals from those arising from methylene and quaternary carbon atoms. Two-dimensional NMR experiments were performed, where appropriate, to aid the assignment of structures. Low-resolution MS spectra were recorded with a Thermo-Finnigan LCQ advantage AP electrospray/ion trap equipped instrument using a syringe pump device to directly inject sample solutions. Microwave promoted reactions were performed with a single-mode Personal Chemistry microwave synthesizer “Emrys Creator,” using sealed glass vessels. The temperature was detected with an infrared sensor. Indoles 1a, 1e, 1k, 1n, 1o, 1p, 1r are commercially available and were used without any further purification. Indoles 1b-d, and 1l are known compounds and were prepared as reported in literature.\textsuperscript{9,20} Indoles 1q and 1s are a known compound and were prepared according to literature procedure.\textsuperscript{21} Indole 1h\textsuperscript{22} and indoles 1i, 1j\textsuperscript{23} were prepared according to the procedures reported in ref. 9 and 20 (see below). Indoles 1f and 1g were prepared as reported in ref. 24 and 8b, respectively.\textsuperscript{24,8b} Indole 1m is a new compound and was prepared as reported below. Aziridines 2a-f are known compounds and were prepared according to standard procedures.\textsuperscript{25} AuCl\textsubscript{3}, AuCl [Au(PPh\textsubscript{3})Cl], [Au(JohnPhos)Cl], [Au(ImPr)Cl], AgNTf\textsubscript{2}, AgOTf, In(O Tf)\textsubscript{3}, Zn(NTf\textsubscript{2}) and TfOH were purchased from commercial suppliers and used as received, the rest of the gold catalysts were prepared according to literature procedures.\textsuperscript{26}

**Preparation and characterization data for compounds 1h-j, m**
2-(phenylethynyl)-1H-indole (1h)\textsuperscript{22}. Ethyl 2-(phenylethynyl)-1H-indole-1-carboxylate\textsuperscript{20} (0.84 g, 2.9 mmol) was dissolved in MeOH (20 mL). Solid K\textsubscript{2}CO\textsubscript{3} (0.40 g, 2.9 mmol) was added and the mixture stirred for 2 h at 40 °C. Then the solvent was removed in vacuum and the residue dissolved in H\textsubscript{2}O/EtOAc 1:1 (50 mL). The two phases were separated and the aqueous layer was extracted with EtOAc (2 x 15 mL). The combined organic layers were dried over Na\textsubscript{2}SO\textsubscript{4}, filtered and concentrated in vacuum to yield the 2-(phenylethynyl)-1H-indole (1h) (0.59 g, 94%) as a yellow solid. \textsuperscript{1}H-NMR (200 MHz, CD\textsubscript{2}Cl\textsubscript{2}): δ 8.39 (s, 1H), 7.59 (m, 3H), 7.40 (m, 4H), 7.27 (t, J = 6.9 Hz, 1H), 7.15 (t, J = 7.3 Hz, 1H), 6.87 (s, 1H). \textsuperscript{13}C-NMR (50 MHz, CD\textsubscript{2}Cl\textsubscript{2}): δ 136.5 (C), 131.6 (2 x CH), 128.9 (CH), 128.7 (2 x CH), 128.0 (C), 123.8 (CH), 122.8 (C), 120.9 (CH), 120.7 (CH), 119.0 (C), 111.0 (CH), 108.8 (CH), 92.6 (C), 81.8 (C). ESI-MS m/z 218 (M+H\textsuperscript{+}, 100). Data are in agreement with those reported in ref. 22.

2-(pent-1-yn-1-yl)-1H-indole (1i). To well stirred solution of ethyl 2-(((trifluoromethyl)sulfonyl)oxy)-1H-indole-1-carboxylate\textsuperscript{20} (1.0 g, 2.96 mmol) and pent-1-yne (0.24 g, 3.55 mmol) in dry DMF (12 mL), Pd(PPh\textsubscript{3})\textsubscript{4} (4 mol\%, 132 mg, 0.12 mmol), CuI (2 mol\%, 11.3 mg, 0.06 mmol) and Et\textsubscript{3}N (8.25 mL, 59.2 mmol) were added. The mixture was then stirred at room temperature until disappearing of starting materials (c.a. 1 h) and then diluted with HCl 0.1 M (100 mL). Aqueous phase was extracted with EtOAc (3 x 50 mL); the combined organic phases were washed with brine (1 x 50 mL), dried over Na\textsubscript{2}SO\textsubscript{4}, filtered and concentrated in vacuum. Purification by column chromatography (Hex/EtOAc 1:1) yielded ethyl 2-(pent-1-yn-1-yl)-1H-indole-1-carboxylate (0.72 g, 95%) as a yellow oil. \textsuperscript{1}H-NMR (200 MHz, CD\textsubscript{2}Cl\textsubscript{2}): δ 8.13 (d, J = 8.2 Hz, 1H), 7.48 (m, 1H), 7.37-7.17 (m, 2H), 6.82 (s, 1H), 4.51 (q, J = 7.1 Hz, 2H), 2.48 (t, J = 7.1 Hz, 2H), 1.68 (sextet, J = 7.1 Hz, 2H), 1.49 (t, J = 7.1 Hz, 3H), 1.08 (t, J = 7.3 Hz, 3H). Ethyl 2-(pent-1-yn-1-yl)-1H-indole-1-carboxylate (0.72 g, 2.82 mmol) was dissolved in MeOH (19 mL). Solid K\textsubscript{2}CO\textsubscript{3} (0.39 g, 2.82 mmol) was added and the mixture was stirred for 2 h at 40 °C. After that time, the solvent was removed in vacuum and the residue was dissolved in H\textsubscript{2}O/EtOAc 1:1 (50 mL). The two phases were separated and aqueous layer was extracted with EtOAc (2 x 15 mL). The combined organic layers were dried over Na\textsubscript{2}SO\textsubscript{4}, filtered and concentrated in vacuum to yield the 2-(pent-1-yn-1-yl)-1H-indole (1i) (0.49 g, 94%) as a brown wax. \textsuperscript{1}H-NMR (200 MHz, CD\textsubscript{2}Cl\textsubscript{2}): δ 8.09 (s, 1H), 7.56 (m, 1H), 7.35-7.02 (m, 3H), 6.28 (s, 1H). Data are in agreement with those reported in ref. \textsuperscript{23}.

2-allyl-1H-indole (1j)\textsuperscript{23}. Ethyl 2-allyl-1H-indole-1-carboxylate\textsuperscript{20} (0.25 g, 1.11 mmol) was dissolved in MeOH (8 mL) and K\textsubscript{2}CO\textsubscript{3} (0.15 g, 1.11 mmol) was added. The mixture was stirred for 30 min at 40 °C. After that time, the solvent was removed in vacuum and the residue was dissolved in H\textsubscript{2}O/EtOAc 1:1 (15 mL). The two phases were separated and aqueous layer was extracted with EtOAc (2 x 5 mL). The combined organic layers were dried over Na\textsubscript{2}SO\textsubscript{4}, filtered and concentrated in vacuum to yield 2-allyl-1H-indole (1j) (0.11 g, 60%) as a white solid. \textsuperscript{1}H-NMR (200 MHz, CD\textsubscript{2}Cl\textsubscript{2}): δ 7.89 (s, 1H), 7.54 (d, J = 6.8 Hz, 1H), 7.36-7.00 (m, 3H), 6.28 (s, 1H), 6.00 (m, 1H), 5.21 (m, 2H), 3.55 (d, J = 6.3 Hz, 2H). Data are in agreement with those reported in ref. 23.

\(N,N\)-diethyl-1H-indol-6-amine (1m). A solution of NaOH 2M (3.7 mL, 7.49 mmol) was added to a stirring solution of 6-(\(N,N\)-diethylamino)-1-(phenylsulfonyl)-1H-indole\textsuperscript{27} (200 mg, 0.61 mmol)
in 7 mL of MeOH and heated at 85 °C under a nitrogen atmosphere. The reaction mixture was stirred for 24 h until no more starting product was detectable by TLC analysis. Methanol was removed under reduced pressure and the crude product was poured into H₂O (25 mL) and extracted with EtOAc (4 × 20 mL), washed with brine and dried over Na₂SO₄. The solvent was removed under reduced pressure and then the residue was purified by flash chromatography over a silica gel column using Hex/EtOAc (7:3) to afford the N,N-diethyl-1H-indol-6-amine (1m) (95 mg, 83%) as pale brown oil. ¹H-NMR (200 MHz, CDCl₃): δ 7.87 (s, 1H), 7.47 (d, J = 9.1 Hz, 1H), 7.01 (m, 1H), 6.78 (m, 2H), 6.42 (m, 1H), 3.36 (q, J = 7.0 Hz, 4H), 1.16 (t, J = 7.0 Hz, 6H).

Preparation and characterization data for compounds 3a-t, (S)3a, (S)3c-e, (S)3k, 3x-y

Representative procedure for gold(I)-catalyzed ring opening of N-tosyl aziridines (procedure A). To a N₂-flushed solution of indole 1a-o (1.0 equiv.) and N₀tosyl aziridine 2a, (R)2a or 2b (1.1 or 1.2 equiv.) in DCE (0.15 M), [Au(JohnPhos)(NTf₂)] (5 mol%) was added and the mixture was stirred at 80 °C for 0.505 h. Solvent was then removed in vacuum and the residue purified by column chromatography (SiO₂) to yield the corresponding product 3a-t, (S)3a, (S)3c-e, (S)3k.

4-methyl-N-(2-phenyl-2-(2-phenyl-1H-indol-3-yl)ethyl)benzenesulfonamide (3a). Procedure A was followed using 2-phenyl-1H-indole (1a) (58 mg, 0.3 mmol), 2-phenyl-1-tosylaziridine (2a) (90.2 mg, 0.33 mmol) and [Au(JohnPhos)(NTf₂)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 8:2) yielded 3a (137 mg, 98%) as a white solid (m.p.: 165-167 °C). ¹H NMR (300 MHz, CDCl₃): δ 8.27 (s, 1H), 7.54-7.38 (m, 8H), 7.32-7.09 (m, 9H), 6.97 (t, J = 7.5 Hz, 1H), 4.49 (dd, J = 10.7, 6.1 Hz, 1H), 4.24 (dd, J = 9.1, 2.8 Hz, 1H), 3.84-3.62 (m, 2H), 2.42 (s, 3H). ¹H NMR (300 MHz, CDCl₃ + D₂O): δ 7.54-7.38 (m, 8H), 7.32-7.09 (m, 9H), 6.97 (t, J = 7.5 Hz, 1H), 4.49 (dd, J = 10.7, 6.1 Hz, 1H), 3.80 (dd, J = 12.2, 6.1 Hz, 1H), 3.70 (dd, J = 10.9, 12.0 Hz, 1H), 2.41 (s, 3H). ¹³C NMR (50 MHz, CDCl₃): δ 143.4 (C), 141.9 (C), 138.0 (C), 136.5 (C), 136.4 (C), 132.4 (C), 129.8 (2 x CH), 129.1 (2 x CH), 128.9 (2 x CH), 128.8 (2 x CH), 128.6 (CH), 127.9 (2 x CH), 127.3 (C), 127.2 (2 x CH), 126.9 (CH), 122.7 (CH), 120.4 (CH), 120.3 (CH), 111.8 (CH), 109.7 (C), 46.9 (CH₂), 42.5 (CH), 21.8 (CH₃). ESI-MS m/z 465 (M+H⁺, 100). Calcd. for C₂₉H₂₆N₂O₂S [466.59]: C 74.65, H 5.62, N 6.00; found C 74.38, H 5.78, N 5.86.

(S)-4-methyl-N-(2-phenyl-2-(2-phenyl-1H-indol-3-yl)ethyl)benzenesulfonamide ((S)3a). Procedure A was followed using (R)-2-phenyl-1-tosylaziridine ((R)2a). (S)3a was obtained in 98% yield and 97% ee. (S)3a was analyzed via chiral-HPLC in comparison with racemic 3a, see supporting information (HPLC section) for details.

4-methyl-N-(2-(1-methyl-2-phenyl-1H-indol-3-yl)-2-phenylethyl)benzenesulfonamide (3b). Procedure A was followed using 1-methyl-2-phenyl-1H-indole (1b) (62 mg, 0.3 mmol), 2-phenyl-1-tosylaziridine (2a) (90.2 mg, 0.33 mmol) and [Au(JohnPhos)(NTf₂)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 8:2) yielded 3b
(137 mg, 95%) as a white thick oil. $^1$H-NMR (300 MHz, CDCl$_3$): $\delta$ 7.55-7.12 (m, 17H), 6.95 (t, $J$ = 7.0 Hz, 1H), 4.25 (dd, $J$ = 10.6, 6.6 Hz, 1H), 3.72-3.51 (m, 5H), 2.44 (s, 3H). $^{13}$C-NMR (75 MHz, CDCl$_3$): $\delta$ 143.6 (C), 142.2 (C), 140.9 (C), 137.8 (C), 136.6 (C) 131.5 (C), 131.2 (2 x CH), 130.0 (2 x CH), 129.0 (CH), 128.9 (2 x CH), 128.8 (2 x CH), 128.0 (2 x CH), 127.5 (2 x CH), 126.9 (C), 126.2 (C), 122.3 (CH), 120.2 (CH), 120.1 (CH), 110.3 (C), 110.2 (CH), 46.9 (CH$_2$), 42.8 (CH), 31.3 (CH$_3$), 21.9 (CH$_3$). ESI-MS m/z 503 [M + Na$^+$, 100]. Calcd. for C$_{30}$H$_{28}$N$_2$O$_2$S [480.63]: C 74.97, H 5.87, N 5.83; found C 75.29, H 5.71, N 5.97.

$N$-(2-(2-(4-isopropoxyphenyl)-1H-indol-3-yl)-2-phenylethyl)-4-methylbenzenesulfonamide (3c). Procedure A was followed using 2-(4-isopropoxyphenyl)-1H-indole (1c) (75.4 mg, 0.3 mmol), 2-phenyl-1-tosylaziridine (2a) (90.2 mg, 0.33 mmol) and [Au(JohnPhos)(NT$_2$)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 8:2) yielded 3c (142 mg, 90%) as a white solid (m.p.: 75-78 °C). $^1$H-NMR (200 MHz, CDCl$_3$): $\delta$ 8.18 (s, 1H), 7.50-7.36 (m, 3H), 7.32-7.08 (m, 11H), 6.97-6.85 (m, 3H), 4.59 (hept, $J$ = 6.0 Hz, 1H), 4.45 (dd, $J$ = 10.7, 6.2 Hz, 1H), 4.22 (dd, $J$ = 9.0, 2.9 Hz, 1H), 3.84-3.55 (m, 2H), 2.40 (s, 3H), 1.39 (s, $J$ = 6.2 Hz, 3H), 1.37 (s, $J$ = 6.0 Hz, 3H). $^{13}$C-NMR (50 MHz, CDCl$_3$): $\delta$ 158.5 (C), 143.3 (C), 142.0 (C), 138.0 (C), 136.5 (C), 136.3 (C), 130.1 (2 x CH), 129.8 (2 x CH), 128.8 (2 x CH), 127.9 (2 x CH), 127.4 (C), 127.2 (2 x CH), 126.9 (CH), 124.4 (C), 122.4 (CH), 120.3 (CH), 120.1 (CH), 116.3 (2 x CH), 111.4 (CH), 109.1 (C), 70.3 (CH), 46.8 (CH$_2$), 42.4 (CH), 22.3 (CH$_3$), 22.2 (CH$_3$), 21.7 (CH$_3$). ESI-MS m/z 523 [M – H$^+$, 100]. Calcd. for C$_{32}$H$_{32}$N$_2$O$_2$S [524.67]: C 73.25, H 6.15, N 5.34; found: C 73.02, H 6.27, N 5.49.

(S)-$N$-(2-(2-(4-isopropoxyphenyl)-1H-indol-3-yl)-2-phenylethyl)-4-methylbenzenesulfonamide ((S)3c). Procedure A was followed using (R)-2-phenyl-1-tosylaziridine ((R)2a). (S)3c was obtained in 89% yield and 98% ee. (S)3c was analyzed via chiral-HPLC in comparison with racemic 3c, see supporting information (HPLC section) for details.

$N$-(2-(2-((3-acetylphenyl)-1H-indol-3-yl)-2-phenylethyl)-4-methylbenzenesulfonamide (3d). Procedure A was followed using 1-((1H-indol-2-yl)phenylethanone (1d) (70.6 mg, 0.3 mmol), 2-phenyl-1-tosylaziridine (2a) (90.2 mg, 0.33 mmol) and [Au(JohnPhos)(NT$_2$)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 7:3) yielded 3d (148 mg, 97%) as a yellowish solid (m.p.: 77-79 °C). $^1$H-NMR (200 MHz, CDCl$_3$): $\delta$ 8.92 (s, 1H), 7.89 (m, 2H), 7.64-7.05 (m, 14H), 6.96 (t, $J$ = 7.2, 1H), 4.48 (m, 2H), 3.75 (m, 2H), 2.42 (s, 3H), 2.37 (s, 3H). $^{13}$C NMR (50 MHz, CDCl$_3$): $\delta$ 198.2 (C), 143.5 (C), 141.8 (C), 137.7 (C), 136.8 (C), 136.7 (C), 136.6 (C), 133.3 (CH), 133.0 (C), 129.8 (2 x CH), 129.3 (CH), 128.9 (2 x CH), 128.9 (CH), 128.0 (2 x CH), 127.3 (C), 127.2 (2 x CH), 127.1 (CH), 122.9 (CH), 120.5 (CH), 120.3 (CH), 112.0 (CH), 110.4 (C), 47.1 (CH$_2$), 43.0 (CH), 26.8 (CH$_3$), 21.7 (CH$_3$). 1 CH$_3$ is overlapping probably with 2xCH at 128.0. ESI-MS m/z 507 [M – H$^+$, 100]. Calcd. for C$_{31}$H$_{29}$N$_2$O$_2$S [508.63]: C 73.20, H 5.55, N 5.51; found: C 73.58, H 5.41, N 5.62.

(S)-$N$-(2-((2-(3-acetylphenyl)-1H-indol-3-yl)-2-phenylethyl)-4-methylbenzenesulfonamide ((S)3d). Procedure A was followed using (R)-2-phenyl-1-tosylaziridine ((R)2a). (S)3d was obtained in 97% yield and 97% ee. (S)3d was analyzed via chiral-HPLC in comparison with racemic 3d, see supporting information (HPLC section) for details.

4-methyl-$N$-(2-(2-methyl-1H-indol-3-yl)-2-phenylethyl)benzenesulfonamide (3e). Procedure A was followed using 2-methyl-1H-indole (1e) (39.4 mg, 0.3 mmol), 2-phenyl-1-tosylaziridine (2a)
4-methyl-N-(2-phenyl-2-(2-vinyl-1H-indol-3-yl)ethyl)benzenesulfonamide (3f). Procedure A was followed using ethyl 2-vinyl-1H-indole (1f) (42.9 mg, 0.3 mmol), 2-phenyl-1-tosylaziridine (2a) (90.2 mg, 0.33 mmol) and [Au(JohnPhos)(NTf₂)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 8:2) yielded 3f (112 mg, 90%) as a yellow wax. 1H-NMR (200 MHz, CDCl₃): δ 7.62 (d, J = 8.3 Hz, 2H), 7.32-7.14 (m, 10H), 6.88 (ddd, J = 8.2, 6.9, 1.1 Hz, 1H), 6.69 (dd, J = 17.5, 11.3 Hz, 1H), 5.52 (d, J = 17.6 Hz, 1H), 5.28 (d, J = 11.3 Hz, 1H), 4.49 (dd, J = 10.3, 6.1 Hz, 1H), 4.30 (dd, J = 8.7, 3.4 Hz, 1H), 3.87 (dd, J = 10.6, 1.1 Hz, 1H), 3.62 (m, 1H), 2.43 (s, 3H). 13C-NMR (50 MHz, CDCl₃): δ 143.4 (C), 142.2 (C), 138.6 (C), 138.1 (C), 137.7 (C), 136.7 (C), 135.7 (CH), 134.1 (C), 129.8 (2 x CH), 128.9 (2 x CH), 128.0 (2 x CH), 127.3 (2 x CH), 127.2 (C), 126.9 (CH), 126.8 (CH), 125.3 (CH), 125.4 (CH), 120.3 (CH), 120.1 (CH), 113.6 (CH₂), 113.0 (C), 111.3 (CH), 46.5 (CH₂), 41.8 (CH), 21.8 (CH₃). ESI-MS m/z 439 [M + Na⁺, 100]. Calcd. for C₂₅H₂₆N₂O₃S [416.54]: C 72.09, H 5.81, N 6.73; found: C 72.37, H 5.88, N 6.72.

(E)-4-methyl-N-(2-(1-methyl-2-(4-methylstyrlyl)-1H-indol-3-yl)-2-phenylethyl)benzenesulfonamide (3g). Procedure A was followed using ethyl (E)-1-methyl-2-(4-methylstyrlyl)-1H-indole (1g) (74.2 mg, 0.3 mmol), 2-phenyl-1-tosylaziridine (2a) (90.2 mg, 0.33 mmol) and [Au(JohnPhos)(NTf₂)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 8:2) yielded 3g (108 mg, 69%) as a yellow wax. 1H-NMR (200 MHz, CDCl₃): δ 7.55 (d, J = 8.3 Hz, 2H), 7.37-7.10 (m, 14H), 6.94 (m, 2H), 6.64 (d, J = 16.5 Hz, 1H), 4.58 (dd, J = 10.5, 6.3 Hz, 1H), 4.30 (dd, J = 8.8, 3.1 Hz, 1H), 3.84-3.59 (m, 5H), 2.39 (s, 3H), 2.34 (s, 3H). 13C-NMR (50 MHz, CDCl₃): δ 143.4 (C), 142.2 (C), 138.6 (C), 138.1 (C), 137.7 (C), 136.7 (C), 135.7 (CH), 134.1 (C), 129.8 (2 x CH), 129.7 (2 x CH), 128.9 (2 x CH), 128.0 (2 x CH), 127.3 (2 x CH), 127.2 (C), 126.9 (CH), 126.8 (CH), 125.3 (CH), 125.4 (CH), 120.3 (CH), 119.8 (CH), 115.7 (CH), 110.7 (C), 109.8 (CH), 47.0 (CH₂), 43.2 (CH), 31.1 (CH₃), 21.6 (CH₃), 21.5 (CH₃). ESI-MS m/z 519 [M + H⁺, 100]. Calcd. for C₃₃H₃₂N₂O₃S [520.68]: C 76.12, H 6.19, N 5.38; found C 76.23, H 6.02, N 5.49.

4-methyl-N-(2-phenyl-2-(2-(phenylethynyl)-1H-indol-3-yl)ethyl)benzenesulfonamide (3h). Procedure A was followed using 2-(phenylethynyl)-1H-indole (1h) (65.2 mg, 0.3 mmol), 2-phenyl-1-tosylaziridine (2a) (90.2 mg, 0.33 mmol) and [Au(JohnPhos)(NTf₂)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 8:2)
yielded 3h (128 mg, 87%) as a yellowish solid (m.p.: 190-192 °C). 1H-NMR (200 MHz, d6-Acetone): δ 10.59 (s, 1H), 7.70 (d, J = 8.3 Hz, 2H), 7.57-7.41 (m, 8H), 7.39-7.09 (m, 7H), 6.99 (t, J = 7.0 Hz, 1H), 6.49 (t, J = 5.5 Hz, 1H), 4.74 (t, J = 8.0 Hz, 1H), 4.08-3.80 (m, 2H), 2.34 (s, 3H).

13C-NMR (50 MHz, d6-Acetone): δ 143.0 (C), 143.1 (C), 138.3 (C), 136.9 (C), 135.2 (C), 134.7 (CH), 129.9 (2 x CH), 128.7 (2 x CH), 127.9 (2 x CH), 127.3 (2 x CH), 127.2 (C), 126.8 (CH), 121.7 (CH), 119.9 (CH), 119.3 (CH), 119.7 (C), 111.2 (CH), 109.7 (CH), 46.6 (CH2), 42.2 (CH), 31.0 (CH2), 21.7 (CH3).

4-methyl-N-(2-(2-(pent-1-yn-1-yl)-1H-indol-3-yl)-2-phenylethyl)benzenesulfonamide (3i). Procedure A was followed using 2-(pent-1-yn-1-yl)-1H-indole (1i) (55 mg, 0.3 mmol), 2-phenyl-1-tosylaziridine (2a) (90.2 mg, 0.33 mmol) and [Au(JohnPhos)(NTf2)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 5:1) yielded 3i (127 mg, 93%) as a white solid (m.p.: 126-128 °C).

1H-NMR (200 MHz, CDCl3): δ 8.06 (s, 1H), 7.60 (d, J = 8.3 Hz, 2H), 7.31-7.07 (m, 9H), 6.92 (t, J = 6.7 Hz, 2H), 4.48 (m, 2H), 3.80 (dd, J = 8.1, 6.3 Hz, 2H), 2.47-2.29 (m, 5H), 1.71-1.53 (m, 2H), 1.02 (t, J = 7.3 Hz, 3H). 13C-NMR (50 MHz, CDCl3): δ 143.4 (C), 141.4 (C), 137.2 (C), 135.9 (C), 129.8 (2 x CH), 128.8 (2 x CH), 128.0 (2 x CH), 127.3 (2 x CH), 126.5 (CH), 126.0 (CH), 120.3 (CH), 119.3 (CH), 118.4 (C), 118.0 (C), 111.1 (CH), 97.4 (C), 72.7 (C), 46.5 (CH2), 43.0 (CH), 22.2 (CH2), 21.8 (CH3), 21.7 (CH2), 13.9 (CH3).

N-(2-(2-allyl-1H-indol-3-yl)-2-phenylethyl)-4-methylbenzenesulfonamide (3j). Procedure A was followed using ethyl 2-allyl-1H-indole (1j) (47.2 mg, 0.3 mmol), 2-phenyl-1-tosylaziridine (2a) (90.2 mg, 0.33 mmol) and [Au(JohnPhos)(NTf2)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 7:3) yielded 3j (103 mg, 80%) as a white wax.

1H NMR (200 MHz, CDCl3): δ 7.99 (s, 1H), 7.60 (d, J = 8.2, 2H), 7.37-7.03 (m, 10H), 6.89 (t, J = 7.5, 1H), 5.87 (m, 1H), 5.2-5.05 (m, 2H), 4.42 (dd, J = 10.4, 6.2 Hz, 2H), 4.31 (dd, J = 9.0, 3.4 Hz, 1H), 3.82 (m, 1H), 3.59 (m, 1H), 3.42 (dd, J = 6.4 Hz, 2H), 2.43 (s, 3H).

13C NMR (50 MHz, CDCl3): δ 143.6 (C), 143.1 (C), 136.9 (C), 136.0 (C), 135.2 (C), 134.7 (CH), 129.9 (2 x CH), 128.7 (2 x CH), 127.9 (2 x CH), 127.3 (2 x CH), 127.2 (C), 126.8 (CH), 121.7 (CH), 119.9 (CH), 119.3 (CH), 119.7 (C), 111.2 (CH), 109.7 (CH), 46.6 (CH2), 42.2 (CH), 31.0 (CH2), 21.7 (CH3).

ESI-MS m/z 455 [M – H+], 100. Calcd. for C28H26N2O2S: 456.60; C 73.65, H 6.18, N 6.14; C 73.37, H 6.12, N 6.26.

N-(2-(1H-indol-3-yl)-2-phenylethyl)-4-methylbenzenesulfonamide (3k). Procedure A was followed using 1H-indole (1k) (51.4 mg, 0.3 mmol), 2-phenyl-1-tosylaziridine (2a) (90.2 mg, 0.33 mmol) and [Au(JohnPhos)(NTf2)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 8:2) yielded 3k (100 mg, 83%) as a white solid (m.p.: 185-188°C).

1H-NMR (200 MHz, DMSO-d6): δ 10.86 (s, 1H), 7.62 (dd, J = 8.1, 1.5 Hz, 2H), 7.39-7.05 (m, 10H), 7.00 (t, J = 8.2 Hz, 1H), 6.85 (t, J = 7.9 Hz, 1H), 4.27 (t, J = 7.7 Hz, 1H), 3.35-3.19 (m, 2H), 2.32 (s, 3H).

13C-NMR (50 MHz, DMSO-d6): δ 143.6 (C), 143.1 (C), 138.3 (C), 136.9 (C), 130.2 (2 x CH), 128.9 (2 x CH), 128.7(2 x CH), 127.2 (2 x CH), 127.1 (C), 126.8 (CH), 122.8 (CH), 121.7 (CH), 119.0 (CH), 116.1 (C), 112.1 (CH), 48.2 (CH2), 43.3 (CH), 21.6
(S)-N-(2-(1H-indol-3-yl)-2-phenylethyl)-4-methylbenzenesulfonamide ((S)3k). Procedure A was followed using (R)-2-phenyl-1-tosylaziridine ((R)2a). (S)3k was obtained in 85% yield and 97% ee. (S)3k was analyzed via chiral-HPLC in comparison with racemic 3k, see supporting information (HPLC section) for details.

4-methyl-N-(2-phenyl-2-(2-phenyl-6-(trifluoromethyl)-1H-indol-3-yl)ethyl)benzenesulfonamide (3l). Procedure A was followed using 2-phenyl-6-(trifluoromethyl)-1H-indole (1l) (78.4 mg, 0.33 mmol), 2-phenyl-1-tosylaziridine (2a) (90.2 mg, 0.33 mmol) and [Au(JohnPhos)(NTf2)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 8:2) yielded 3l (156 mg, 97%) as a white solid (m.p.: 201-203 °C). 

$^{1}$H-NMR (200 MHz, CDCl3): δ 8.64 (s, 1H), 7.68 (s, 1H), 7.46-7.34 (m, 7H), 7.32-6.99 (m, 9H), 4.49 (dd, $J$ = 10.7, 6.0 Hz, 1H), 4.13 (m, 1H), 3.69 (m, 2H), 2.40 (s, 3H). $^{13}$C-NMR (50 MHz, CDCl3): δ 143.6 (C), 141.2 (C), 140.6 (C), 136.4 (C), 135.3 (C), 131.6 (C), 129.8 (2 x CH), 129.5 (C), 129.2 (2 x CH), 129.1 (CH), 129.0 (2 x CH), 128.9 (2 x CH), 127.8 (2 x CH), 127.1 (2 x CH), 125.2 (q, $J$ = 271 Hz, C), 124.6 (q, $J$ = 32 Hz, C), 120.4 (CH), 116.9 (q, $J$ = 3.5 Hz, CH), 110.5 (C), 109.1 (q, $J$ = 4.3 Hz, CH), 46.8 (CH3), 42.2 (CH), 21.6 (CH3). ESI-MS m/z 533 [M – H$^+$, 100]. Calcd for C$_{30}$H$_{23}$F$_3$N$_2$O$_5$: C 74.01, H 6.77, N 9.10; found C 74.01, H 6.77, N 9.10.

Ethyl 3-(2-(4-methylphenylsulfonamido)-1-phenylethyl)-1H-indole-2-carboxylate (3n). Procedure A was followed using ethyl 1H-indole-2-carboxylate (1n) (56.7 mg, 0.3 mmol), 2-phenyl-1-tosylaziridine (2a) (90.2 mg, 0.33 mmol) and [Au(JohnPhos)(NTf2)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 8:2) yielded 3n (75 mg, 54%) as a white solid (m.p.: 175-177 °C). 

$^{1}$H-NMR (200 MHz, CDCl3): δ 7.45 (d, $J$ = 8.4 Hz, 1H), 7.36 (d, $J$ = 8.1 Hz, 2H), 7.19-7.12 (m, 3H), 6.98-6.89 (m, 4H), 6.58 (d, $J$ = 8.1 Hz, 2H), 6.26-6.22 (m, 2H), 5.41 (t, $J$ = 7.0 Hz, 1H), 4.73 (bs, 1H), 3.94-3.84 (m, 1H), 3.47-3.36 (m, 1H), 2.77 (q, $J$ = 7.0 Hz, 4H), 1.83 (s, 3H), 0.86 (t, $J$ = 7.0 Hz, 6H). $^{13}$C NMR (50 MHz, CDCl3): δ 145.0 (C), 142.3 (C), 140.9 (C), 137.3 (C), 135.1 (C), 129.3 (2 x CH), 129.0 (2 x CH), 127.1 (2 x CH), 126.8 (C), 126.7 (2 x CH), 124.6 (CH), 121.6 (C), 120.4 (CH), 116.1 (CH), 102.3 (CH), 49.5 (CH2), 45.8 (2 x CH2), 40.7 (CH), 20.9 (CH3), 12.8 (2 x CH3). 1 CH$_{ar}$ is missing, probably overlapping. ESI-MS m/z 484 [M + Na$^+$, 100], 462 [M + H$^+$, 60]. Calcd for C$_{27}$H$_{31}$N$_3$O$_5$: C 70.25, H 6.77, N 9.10; found C 70.15, H 6.53, N 9.07.
Ethyl 5-fluoro-3-(2-(4-methylphenylsulfonamido)-1-phenylethyl)-1H-indole-2-carboxylate (3o). Procedure A was followed using ethyl 5-fluoro-1H-indole-2-carboxylate (1o) (62.2 mg, 0.3 mmol), 2-phenyl-1-tosylaziridine (2a) (90.2 mg, 0.33 mmol) and [Au(JohnPhos)(NTf₂)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 8:2) yielded 3o (75 mg, 54%) as a white solid (m.p.: 129-130 °C). 1H-NMR (200 MHz, CDCl₃): δ 9.27 (s, 1H), 7.79 (d, J = 8.3 Hz, 1H), 7.57 (d, J = 8.3 Hz, 2H), 7.35-7.12 (m, 7H), 6.99 (td, J = 9.0, 2.4 Hz, 1H), 6.78 (dd, J = 9.9, 2.3 Hz, 1H), 5.33 (dd, J = 5.9, 10.4 Hz, 1H), 4.90 (m, 1H), 4.29 (q, J = 7.1 Hz, 2H), 3.89 (dt, J = 12.7, 6.4 Hz, 1H), 3.69 (td, J = 11.8, 4.6 Hz, 1H), 2.40 (s, 3H), 1.37 (t, J = 7.1 Hz, 3H). 13C NMR (50 MHz, CDCl₃): δ 162.0 (C), 157.8 (d, J_C,F = 237 Hz, C), 143.5 (C), 140.7 (C), 136.7 (C), 133.0 (C), 129.8 (2 x CH), 128.8 (2 x CH), 127.8 (2 x CH), 127.1 (2 x CH), 127.0 (CH), 126.4 (C), 121.7 (d, J_C,F = 5.5 Hz, C), 114.9 (d, J_C,F = 27 Hz, CH), 113.5 (d, J_C,F = 9.4 Hz, CH), 106.3 (d, J_C,F = 24 Hz, CH), 61.7 (CH₂), 46.2 (CH₂), 41.3 (CH), 21.7 (CH₃), 14.5 (CH₃). ESI-MS m/z 479 [M – H⁺, 100]. Calcd. for C₂₃H₂₅FN₂O₂S [480.55]: C 64.98, H 5.24, N 5.83; found: C 64.72, H 5.38, N 5.91.

4-methyl-N-(2-(2-phenyl-1H-indol-3-yl)ethyl)benzenesulfonamide (3p). Procedure A was followed using 2-phenyl-1H-indole (1a) (58 mg, 0.3 mmol), 1-tosylaziridine (2b) (71 mg, 0.36 mmol, 1.2 equiv.) and [Au(JohnPhos)(NTf₂)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 8:2) yielded 3p (77 mg, 66%) as a white solid (m.p.: 129-130 °C). 1H-NMR (200 MHz, CDCl₃): δ 8.16 (s, 1H), 7.58 (d, J = 8.3 Hz, 2H), 7.51-7.33 (m, 7H), 7.27-7.03 (m, 4H), 4.40 (t, J = 6.0 Hz, 1H), 3.26 (m, 2H), 3.07 (m, 2H), 2.39 (s, 3H). 13C NMR (50 MHz, CDCl₃): δ 143.4 (C), 137.1 (C), 136.1 (C), 135.9 (C), 132.8 (C), 129.8 (2 x CH), 129.2 (2 x CH), 128.8 (C), 128.4 (2 x CH), 128.2 (CH), 127.2 (2 x CH), 122.8 (CH), 120.2 (CH), 119.0 (CH), 111.2 (CH), 108.6 (C), 43.4 (CH₂), 25.2 (CH₂), 21.7 (CH₃). ESI-MS m/z 389 [M – H⁺, 100]. Calcd. for C₂₃H₂₂N₂O₂S [390.50]: C 70.74, H 5.68, N 7.17; found C 70.95, H 5.56, N 7.01.

N-(2-(2-(4-isopropoxyphenyl)-1H-indol-3-yl)ethyl)-4-methylbenzenesulfonamide (3q). Procedure A was followed using 2-(4-isopropoxyphenyl)-1H-indole (1c) (75.3 mg, 0.3 mmol), 1-tosylaziridine (2b) (71 mg, 0.36 mmol, 1.2 equiv.) and [Au(JohnPhos)(NTf₂)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 8:2) yielded 3q (96 mg, 71%) as a white solid (m.p.: 54-55 °C). 1H-NMR (200 MHz, CDCl₃): δ 8.12 (s, 1H), 7.57 (d, J = 8.4 Hz, 2H), 7.44-7.31 (m, 4H), 7.22-7.01 (m, 4H), 6.93 (d, J = 8.9 Hz, 2H), 4.59 (hept, J = 6.0 Hz, 1H), 4.41 (t, J = 6.1 Hz, 1H), 3.26 (m, 2H), 3.04 (m, 2H), 2.39 (s, 3H), 1.38 (d, J = 6.1 Hz, 6H). 13C NMR (50 MHz, CDCl₃): δ 158.1 (C), 143.3 (C), 137.1 (C), 136.1 (C), 135.9 (C), 129.8 (2 x CH), 129.6 (2 x CH), 128.9 (C), 127.2 (2 x CH), 124.8 (C), 122.4 (CH), 120.1 (CH), 118.7 (CH), 116.4 (2 x CH), 111.1 (CH), 107.7 (C), 70.3 (CH), 43.4 (CH₂), 25.2 (CH₂), 22.3 (CH₃), 21.7 (CH₃). ESI-MS m/z 447 [M – H⁺, 100]. Calcd. for C₂₆H₂₆N₂O₃S [448.58]: C 69.62, H 6.29, N 6.25; found C 69.86, H 6.32, N 6.18.

N-(2-(2-(3-acetylphenyl)-1H-indol-3-yl)ethyl)-4-methylbenzenesulfonamide (3r). Procedure A was followed using 1-(3-((1H-indol-2-yl)phenylethanone (1d) (70.6 mg, 0.3 mmol), 1-tosylaziridine (2b) (71 mg, 0.36 mmol, 1.2 equiv.) and [Au(JohnPhos)(NTf₂)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 7:3)
yielded 3r (80 mg, 62%) as a yellowish solid (m.p.: 52.5-54 °C). 

**1H-NMR** (200 MHz, CDCl3): δ 8.59 (s, 1H), 8.06 (m, 1H), 7.86 (d, J = 7.5 Hz, 1H), 7.73 (d, J = 7.8 Hz, 1H), 7.62-7.30 (m, 5H), 7.27-7.01 (m, 4H), 4.80 (t, J = 6.1 Hz, 1H), 3.27 (m, 2H), 3.08 (m, 2H), 2.58 (s, 3H), 2.37 (s, 3H). 

**13C-NMR** (50 MHz, CDCl3): δ 198.4 (C), 143.5 (C), 135.7 (C), 133.1 (C), 129.2 (C), 129.2 (2 x CH), 129.5 (CH), 128.7 (C), 127.9 (CH), 127.9 (CH), 127.2 (2 x CH), 123.1 (CH), 120.3 (CH), 119.1 (CH), 111.5 (CH), 109.3 (C), 43.5 (CH2), 26.9 (CH3), 25.5 (CH3), 21.7 (CH3). ESI-MS m/z 431 [M + H+, 100]. Calcd. for C25H32N2O2S [432.53]: C 69.42, H 5.48; found C 69.84, H 5.47, N 6.22.

**4-methyl-N-(2-(2-methyl-1H-indol-3-yl)ethyl)benzenesulfonamide (3s).** Procedure A was followed using 2-methyl-1H-indole (1a) (58 mg, 0.3 mmol), 1-tosylaziridine (2b) (71 mg, 0.36 mmol, 1.2 equiv.) and [Au(JohnPhos)(NTf2)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 8:2) yielded 3s (70 mg, 71%) as a white wax. 

**1H-NMR** (200 MHz, CDCl3): δ 8.03 (s, 1H), 7.64 (d, J = 8.3 Hz, 3H), 7.45-6.92 (m, 7H), 4.38 (t, J = 5.9 Hz, 1H), 3.28 (m, 2H), 2.93 (m, 2H), 2.40 (s, 3H), 2.35 (s, 3H). 

**13C-NMR** (50 MHz, CDCl3): δ 143.5 (C), 137.1 (C), 135.6 (C), 132.7 (C), 129.8 (2 x CH), 128.4 (C), 127.2 (2 x CH), 121.4 (CH), 119.6 (CH), 117.8 (CH), 110.7 (CH), 107.3 (C), 43.4 (CH2), 24.9 (CH2), 21.7 (CH3), 11.8 (CH3). ESI-MS m/z 327 [M – H+, 65]. Calcd. for C18H20N2O2S [328.43]: C 65.83, H 6.14, N 8.53; found C 65.11, H 6.00, N 8.77.

**N-(2-(1H-indol-3-yl)ethyl)-4-methylbenzenesulfonamide (3t).** Procedure A was followed using 1H-indole (1k) (35 mg, 0.3 mmol), 1-tosylaziridine (2b) (71 mg, 0.36 mmol, 1.2 equiv.) and [Au(JohnPhos)(NTf2)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 9:1) yielded 3t (65 mg, 69%) as a white wax. 

**1H-NMR** (200 MHz, CDCl3): δ 8.03 (s, 1H), 7.64 (d, J = 8.3 Hz, 3H), 7.45-6.92 (m, 7H), 4.38 (t, J = 5.9 Hz, 1H), 3.28 (m, 2H), 2.93 (m, 2H), 2.40 (s, 3H). 

**13C-NMR** (50 MHz, CDCl3): δ 143.5 (C), 137.1 (C), 136.7 (C), 129.8 (2 x CH), 127.2 (2 x CH), 122.9 (CH), 122.4 (CH), 119.7 (CH), 118.7 (CH), 111.8 (C), 111.6 (CH), 43.3 (CH2), 25.7 (CH3), 21.7 (CH3). ESI-MS m/z 313 [M – H+, 100]. Calcd. for C17H18N2O2S [314.40]: C 64.94, H 5.77, N 8.91; found C 65.19, H 5.83, N 8.87.

**benzyl (2-(2-phenyl-1H-indol-3-yl)ethyl)carbamate (3x).** Procedure A was followed using 2-phenyl-1H-indole (1a) (58 mg, 0.3 mmol), benzyl aziridine-1-carboxylate (2d) (64 mg, 0.36 mmol, 1.2 equiv.) and [Au(JohnPhos)(NTf2)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 9:1) yielded 3x (63 mg, 57%) as a white solid (m.p.: 46-48 °C). 

**1H-NMR** (300 MHz, CDCl3): δ 8.26 (s, 1H), 7.69-7.12 (m, 14H), 5.05 (s, 1H), 4.84 (t, J = 6.0 Hz, 1H), 3.53 (q, J = 6.8 Hz, 2H), 3.13 (t, J = 7.1 Hz, 2H). 

**13C-NMR** (75 MHz, CDCl3): δ 156.6 (C), 136.9 (C), 136.1 (C), 135.7 (C), 133.1 (C), 129.2 (C), 129.2 (2 x CH), 128.7 (CH), 128.3 (4 x CH), 128.2 (2 x CH), 128.1 (CH2), 122.7 (CH), 120.1 (CH), 119.3 (CH), 111.2 (CH), 109.8 (C), 66.7 (CH2), 41.8 (CH2), 25.3 (CH3). ESI-MS m/z 371 [M + Na+, 75], 371 [M + H+, 100]. Calcd. for C24H22N2O2 [370.44]: C 77.81, H 5.99, N 7.56; found C 77.69, H 5.87, N 7.68.

**4-methyl-N-(2-(2-phenyl-1H-indol-3-yl)cyclohexyl)benzenesulfonamide (3y).** Procedure A was followed using 2-phenyl-1H-indole (1a) (58 mg, 0.3 mmol), 7-tosyl-7-azabicyclo[4.1.0]heptane (2e) (91 mg, 0.36 mmol, 1.2 equiv.) and [Au(JohnPhos)(NTf2)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 8:2) yielded 3y (35 mg, 26%) as a white wax. 

**1H-NMR** (300 MHz, CDCl3): δ 8.02 (s, 1H), 7.51-7.39 (m, 5H), 7.29-7.18
(m, 2H), 7.15-7.08 (m, 3H), 6.84-6.77 (m, 3H), 4.15 (m, 1H), 3.43 (m, 1H), 2.83 (ddd, J = 12.2, 10.8, 4.1, 1H), 2.52 (m, 1H), 2.30 (s, 3H), 1.88 (m, 3H), 1.30 (m, 4H). $^{13}$C NMR (75 MHz, CDCl$_3$): δ 142.6 (C), 136.4 (2 x C), 136.0 (C), 132.7 (C), 129.3 (2 x CH), 129.2 (2 x CH), 129.0 (2 x CH), 128.6 (CH), 126.6 (2 x CH), 122.1 (CH), 120.3 (CH), 119.7 (CH), 112.5 (C), 111.3 (CH), 56.3 (CH), 41.7 (CH), 35.0 (CH$_2$), 32.5 (CH$_2$), 26.2 (CH$_2$), 25.3 (CH$_2$), 21.8 (CH$_3$) (one quaternary carbon is missing, probably overlapped with one negative signal, CH). ESI-MS m/z 444 [M + H$^+$], 100. Calcd. for C$_{27}$H$_{28}$N$_2$O$_2$S [444.59]: C 72.94, H 6.35, N 6.30; found C 72.86, H 6.12, N 6.41.

Representative procedures for the ring opening reactions of 2-methyl-N-tosyl aziridine (2c and (S)2c) – see table 2 for details.

**Table 2, entries 1, 2, 3 general procedure.** To a N$_2$-flushed solution of indole 1a,c,e (1.0 equiv.) and 2-methyl-N-tosyl aziridine (2c) (1.1 equiv.) in DCE (0.15 M), [Au(JohnPhos)(NTf$_2$)] (5 mol%) was added and the mixture was stirred at 80 °C for 24 h. Solvent was then removed in vacuum and the residue was purified by column chromatography (SiO$_2$) to yield the corresponding product 3u-w/3'u-w as inseparable mixtures.

4-methyl-N-(2-(2-phenyl-1H-indol-3-yl)propyl)benzenesulfonamide (3u) and 4-methyl-N-(1-(2-phenyl-1H-indol-3-yl)propan-2-yl)benzenesulfonamide (3'u). General procedure was followed using 1H-indole 1a (39.0 mg, 0.2 mmol), aziridine 2c (46.5 mg, 0.22 mmol) and [Au(JohnPhos)(NTf$_2$)] (7.75 mg, 0.01 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 8:2) yielded 3u/3'u (79.3 mg, 98%) in 2:1 ratio as a white solid. Ratio and identity of the two regioisomers were established via 1D and 2D NMR analysis. See copy of original spectra enclosed in the supporting information. ESI-MS m/z 403 [M – H$^+$], 100. Reported data are in agreement with those reported in literature.$^{3i}$

N-(2-(2-(4-isopropoxyphenyl)-1H-indol-3-yl)propyl)-4-methylbenzenesulfonamide (3v) and N-(1-(2-(4-isopropoxyphenyl)-1H-indol-3-yl)propan-2-yl)-4-methylbenzenesulfonamide (3'v). General procedure was followed using 1H-indole 1c (75.4 mg, 0.3 mmol), aziridine 2c (69.7 mg, 0.33 mmol) and [Au(JohnPhos)(NTf$_2$)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 8:2) yielded 3v/3'v (120 mg, 86%) in 2:1 ratio as a pink solid. Ratio and identity of the two regioisomers were established by analogy with 3u/3'u via $^1$H NMR analysis. See copy of original spectra enclosed in the supporting information. ESI-MS m/z 461 [M – H$^+$], 100.

4-methyl-N-(2-(2-methyl-1H-indol-3-yl)propyl)benzenesulfonamide (3w) and 4-methyl-N-(1-(2-methyl-1H-indol-3-yl)propan-2-yl)benzenesulfonamide (3'w). General procedure was followed using 1H-indole 1e (39.5 mg, 0.3 mmol), aziridine 2c (69.7 mg, 0.33 mmol) and [Au(JohnPhos)(NTf$_2$)] (11.6 mg, 0.015 mmol) in DCE (2 mL). Purification of the crude by column chromatography (Hex/EtOAc 8:2) yielded 3w/3'w (94.4 mg, 92%) in 2:1 ratio as a pink thick oil. Ratio and identity of the two regioisomers were established by analogy with 3u/3'u via $^1$H NMR analysis. See copy of original spectra enclosed in the supporting information. ESI-MS m/z 341 [M – H$^+$], 100.
Table 2, entry 4. To a solution of 1H-indole 1a (58.0 mg, 0.3 mmol) and aziridine 2c (42.3 mg, 0.2 mmol) in DCM (1 mL) boron trifluoride etherate (0.04 mL, 0.3 mmol) was added at room temperature over a period of 10 min. The solution was stirred for 24 h. and quenched with 5% aqueous NaHCO₃ solution (1 mL). The two phases were separated and aqueous layer was extracted with DCM (2 x 1mL). The combined organic layers were dried over Na₂SO₄, filtered and concentrated in vacuum. Purification by column chromatography (Hex/EtOAc 8:2) yielded 3u and 3′u (43 mg, 55%) as inseparable mixture in 12:1 ratio as a white solid. Reported data refers to major isomer and are in agreement with those reported in ref. 3i.

1H-NMR (200 MHz, CDCl₃): δ 8.10 (s, 1H), 7.49-7.30 (m, 9H), 7.26-7.15 (m, 3H), 6.99 (t, J = 7.3 Hz, 1H), 4.18 (d, J = 7.1 Hz, 1H), 3.32 (m, 3H), 2.40 (s, 3H), 1.39 (d, J = 5.9 Hz, 3H).

13C NMR (50 MHz, CDCl₃): δ 143.2 (C), 136.7 (C), 136.5 (2 x C), 132.8 (C), 129.7 (2 x CH), 129.1 (2 x CH), 129.0 (2 x CH), 128.4 (CH), 127.1 (2 x CH), 126.7 (C), 126.5 (CH), 120.0 (CH), 119.9 (CH), 112.9 (C), 111.5 (CH), 48.1 (CH₂), 31.8 (CH), 21.7 (CH₃), 19.0 (CH₃).

ESI-MS m/z 427 [M + Na⁺, 100].

Table 2, entry 12. To a N₂-flushed solution of AuCl (2.3 mg, 0.01 mmol) and AgSbF₆ (3.4 mg, 0.01 mmol) in DCE (1.33 mL), indole 1a (77.3 mg, 0.4 mmol) and aziridine 2c (42.3 mg, 0.20 mmol) were added and the mixture was stirred for 24 h at 80 °C. Solvent was then removed in vacuum and the residue was purified by column chromatography (Hex/EtOAc 8:2) yielding 3u/3′u (51 mg, 70%) as inseparable mixture in 7:1 ratio as a white solid. Ratio and identity of the two regioisomers were established via 1H NMR analysis and are in agreement with those reported in ref. 12. See the enclosed copy of original spectra. The same reaction was performed using (S)-020 methyl010tosylaziridine ((S)2c). The purified reaction mixture was analyzed via chiral-HPLC, see supporting information (HPLC section) for details.

Preparation and characterization data for compounds (±)4a-d and (±)4′a-c

(±)-3a,8-dimethyl-3-phenyl-1-tosyl-1,2,3,3a,8,8a-hexahydropyrrolo[2,3-b]indole ((±)4a and (±)4′a). Procedure A was followed using 1,3-dimethyl-indole (1p) (87.1 mg, 0.6 mmol), aziridine 2a (197 mg, 0.72 mmol) and [Au(JohnPhos)(NTf₂)] (23.3 mg, 0.03 mmol) in DCE (4 mL). Purification of the crude by column chromatography (Hex/DCM 1:1) yielded progressively (±)4a and (±)4′a (170 mg, overall yield 68%, ratio 60:40 ) as white solids (m.p.: (±)4a 115-117.2 °C; (±)4′a 173-176 °C). (±)4a <sup>16b</sup>: 1H NMR (300 MHz, CDCl₃): δ 7.86 (d, J = 8.3 Hz, 2H), 7.42 (d, J = 8.0 Hz, 2H), 7.29-7.23 (m, 3H), 7.05 (dt, J = 7.7, 1.3 Hz, 1H), 6.85 (d, J = 6.2, 2H), 6.39 (d, J = 7.8 Hz, 1H), 6.31 (t, J = 7.4 Hz, 1H), 5.60 (d, J = 7.4 Hz, 1H), 5.40 (s, 1H), 3.80 (dd, J = 12.2, 6.5 Hz, 1H), 3.42 (t, J = 12.4 Hz, 1H), 3.07 (s, 3H), 2.76 (dd, J = 12.6, 6.5 Hz, 1H), 2.50 (s, 3H), 1.31 (s, 3H). 13C NMR (75 MHz, CDCl₃): δ 151.2 (C), 144.2 (C), 137.6 (C), 136.1 (C), 130.3 (2 x CH), 129.2 (2 x CH), 129.0 (C), 128.8 (CH), 128.3 (2 x CH), 127.9 (CH), 127.7 (2 x CH), 125.8 (CH), 116.8 (CH), 105.4 (CH), 91.5 (CH), 57.1 (C), 55.4 (CH), 51.6 (CH₂), 31.7 (CH₃), 26.4 (CH₃), 22.0 (CH₃). 13 See supporting information for details.

The stereochemistry of the indoline products was tentatively assigned by analogy with the results reported by Zhao et al. (ref. 16a). Thus, they synthesized almost pure (S,S,S)$^{3a}$, (R,R,R)$^{3a}$ and (S,S,S)$^{3b}$ which structures were established by single-crystal X-ray diffraction.
