Transforming PPh₃ into bidentate phosphine ligands at Ru–Zn heterobimetallic complexes†‡

The reaction of $[Ru(PPh_3)_3Cl_2]$ with excess $ZnMe_2$ led to P-C/C-H bond activation and P-C/C-C bond formation to generate a chelating diphenylphosphinobenzene ligand as well as a cyclometallated (diphenylphosphino)biphenyl group in the final product of the reaction, $[Ru(dppbz)(PPh_2(biphenyl)'](ZnMe)]$ (1; dppbz = 1,2-bis(diphenylphosphino)benzene); $PPh_2(biphenyl)' = cyclometallated PPh_2(biphenyl)$. The mechanism of reaction was studied and C-C coupling to give a bidentate 2,2'-bis(diphenylphosphino) biphenyl (BIPHEP) ligand was suggested to be one of the key steps of the process. This was confirmed by the reaction of $[Ru(BIPHEP)(PPh_3)HCl]$ with $ZnMe_2$, which also gave 1. An analogous set of steps took place upon addition of $ZnMe_2$ to $[Ru(rac-BINAP)(PPh_3)HCl]$ (rac-BINAP = racemic(2,2'-bis(diphenylphosphino)-1,1'-binaphthyl) to give $[Ru(dppbz)(PPh_2(binaphthyl)')ZnMe]$ (3). H_2 and the C-H bond of PhC = CH added across the Ru-Zn bond of 1, and also reversed the phosphine cyclometallation, to give $[Ru(dppbz)(Ph_2P(biphenyl))(C = CPh)_2(H)(ZnMe)]$ (5) respectively.

Introduction

Alkane elimination resulting from the treatment of a transition metal hydride (TM-H) complex with a main group hydrocarbyl (MG-R) reagent represents an established, but still under-utilised synthetic route to TM-MG heterobimetallic complexes. We have recently employed this approach to good effect with ruthenium N-heterocyclic carbene (NHC) and/or phosphine hydride precursors and MG(alkyl) $_n$ (n=2, 3) compounds to generate a number of new Ru-MG (MG = Zn, In, Ga) complexes (Scheme 1). $^{2-4}$

With the cationic hydride precursors $[Ru(NHC)_2(CO)H][BAr^F_4]$ (NHC = IPr, IBiox (see Scheme 1 for structures); $[BAr^F_4] = [B(3,5-(F_3C)_2C_6H_3)_4]$), elimination of a single equivalent of C_2H_6 or CH_4 took place upon addition of ZnR_2 (R = Et, Me) to give $[Ru(NHC)_2(CO)ZnR][BAr^F_4]$ (A, D).^{2,3} These complexes contain unsupported Ru–Zn bonds, which in the case of the IPr compounds, react readily with a range of E–H (E = H, B, Si) bonds. Addition of the group 13 trialkyls MMe₃

(M = Ga, In) to $[Ru(IPr)_2(CO)H]^+$ resulted in chemistry that was different not only to that of ZnR_2 , but also to each other. With $InMe_3$, methane loss was followed by methyl migration from $In to Ru to generate [Ru(IPr)_2(CO)(InMe)Me][BAr^F_4] (B)$. With $GaMe_3$, a more complex set of reactions occurred that led ultimately to migration of an IPr ligand from Ru to Ga to yield C.

The addition of excess $ZnMe_2$ to the neutral mixed NHC/phosphine precursor [Ru(IMes)(PPh₃)(CO)HCl] induced loss of two equivalents of CH_4 , as well as ZnMeCl, to give the cyclometallated carbene complex [Ru(IMes)'(PPh₃)(CO)(ZnMe)]

Scheme 1 Examples of our recently reported Ru–MG heterobimetallic complexes. The $[\mathsf{BAr}^\mathsf{F}_4]$ anion in each of the charged species has been omitted for clarity.

Dalton Transactions

E ((IMes)' = cyclometallated IMes).3 We have also established that the elimination of more than one equivalent of alkane is a feature of the reactions of [Ru(PPh₃)₃HCl] with ZnMe₂ (as well as LiCH2SiMe3 and MgMe2), the second equivalent of alkane now arising from Ru-H intermediates generated upon cyclometallation of a PPh₃ ligand.⁵ Given the wealth of Ru-PPh₃ precursors, we turned our attention to a non-hydride containing example to probe whether PPh3 metalation still took place. Herein, we show that the reaction of [Ru(PPh₃)₃Cl₂] with ZnMe2 results in a remarkable series of C-H and P-C bond activation, as well as P-C and C-C bond formation, steps to generate $[Ru(dppbz)(PPh_2(biphenyl)')(ZnMe)]$ (1; dppbz = 1,2bis(diphenylphosphino)benzene; PPh2(biphenyl)' = cyclometallated PPh₂(biphenyl)). The order of these transformations on the pathway to formation of the chelating diphenylphosphinobenzene and cyclometallated (diphenylphosphino)biphenyl ligands has been probed by ¹H and ³¹P NMR spectroscopy. Initial studies of the reactivity of 1 show that both H2 and the C-H bond of an alkyne can add across the Ru-Zn bond, with reversal of Ph₂P(biphenyl) metalation also taking place.

Results and discussion

Characterisation of [Ru(dppbz)(PPh2(biphenyl)')ZnMe] (1) and trapping with CO

Treatment of [Ru(PPh₃)₃Cl₂] with ZnMe₂ (5 equiv.)⁶ in THF led to the evolution of a single red product over 48 h, which characterised as [Ru(dppbz)(PPh₂(biphenyl)')ZnMe] (1, Scheme 2) arising from the remarkable transformation of two of the PPh₃ ligands into a bidentate bis(diphenylphosphino) benzene ligand, and conversion of the third PPh3 into a (diphenylphosphino)biphenyl ligand, which undergoes cyclometallation at the ruthenium centre.⁷

Fig. 1 shows the X-ray structure of 1. The geometry can be described as a distorted square pyramid based on maximum

Scheme 2 Formation of [Ru(dppbz)(PPh2(biphenyl)')ZnMe] (1) and trapping by CO.

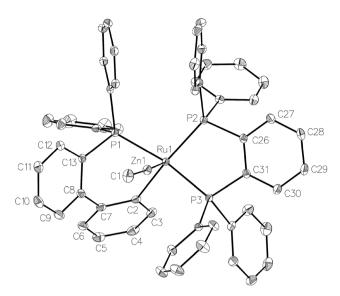

Fig. 1 Molecular structure of 1. Ellipsoids are represented at 30% probability. Hydrogen atoms and guest solvent have been omitted for clarity.

deviations of +0.264 Å and -0.297 Å for P1 and C2, respectively, either side of the mean-plane containing atoms Ru1, P1, P2, P3 and C2. The apical position in the structure is occupied by the ZnMe ligand, which is trans to a vacant site.8 The Ru-Zn distance of 2.3713(3) \mathring{A} is shorter than that in A (R = Me; 2.4069(7) Å), **D** (2.3997(8) Å) or **E** (2.3819(4) Å).³

Dissolution of 1 in C₆D₆ gave a ³¹P{¹H} NMR spectrum (ESI‡) comprising of two sets of three resonances in a 5:1 mixture, which were assigned as diastereomers (Scheme 2) by comparison to the results from the reaction of [Ru(BINAP)(PPh3)HCl] with ZnMe2 described below. The major isomer of 1 exhibited a doublet of doublets (${}^{2}J_{PP}$ = 257, 3 Hz) resonance at δ 65, assigned to one terminus of the dppbz ligand. The large ${}^{2}J_{PP}$ splitting of 257 Hz arises from coupling to the trans-cyclometallated Ph2P(biphenyl)' ligand, which itself appeared as a doublet of doublets (${}^{2}J_{PP}$ = 257, 18 Hz) at δ 51. The small couplings of 18 and 3 Hz showed that both phosphorus nuclei were cis to the second terminus of the dppbz ligand, which appeared at δ 79. The minor diastereomer exhibited analogous signals at δ 78, 62 and 69 respectively, with similar sized coupling constants. Interconversion of the two diastereomers was shown by ³¹P{¹H} EXSY measurements (ESI‡).

Trapping of 1 by CO gave the coordinatively saturated carbonyl complex, [Ru(dppbz)(PPh2(biphenyl)')(CO)ZnMe] (2, Scheme 2) in a rapid reaction that was accompanied by colour change from red to pale yellow. Complex 2 was characterised by a combination of NMR and IR data, but proved elusive to crystallographic characterisation. As in the case of 1, 2 was present in solution as what we believe is a mixture of two diastereomers, in a ratio of ca. 1:1.3. The minor isomer appeared in the room temperature ³¹P{¹H} NMR spectrum as two sharp, overlapping doublets at δ 67, with couplings of 243 and 18 Hz, and a sharp doublet of doublets at δ 47 (${}^2J_{\rm PP}$ = 243, 18 Hz), whereas the major isomer displayed three very broad signals.

Paper

These resolved upon cooling to 223 K into a doublet of doublets at δ 75 (${}^2J_{\rm PP}$ = 241, 12 Hz), a broad triplet at δ 59 and a second doublet of doublets at δ 46 (${}^2J_{\rm PP}$ = 241, 18 Hz). The solution IR spectrum of 2 (in C₆D₅CD₃) showed a carbonyl stretch for each of the two isomers at 1934 cm⁻¹ and

1911 cm⁻¹ (ESI‡). When 1 was reacted with 13 CO, each of the 31 P resonances of 2- 13 CO exhibited an additional doublet with a $^2J_{PC}$ splitting of 7–11 Hz (ESI‡). A geometry in which all three phosphorus nuclei are *cis* to the carbonyl ligand is implied by the magnitude of these couplings, but the absence of an X-ray structure precluded us from being able to elucidate whether the ZnMe was *trans* to CO or a phosphine (Scheme 2). In the 13 C{ 1 H} NMR spectrum of 2- 13 CO, the carbonyl resonance of the minor diastereomer appeared as a sharp quartet ($^2J_{CP}$ = 8 Hz) at δ 204 at room temperature (this broadened upon cooling), whereas

Mechanism of formation of 1

resonance at δ 209, even down at 211 K.

³¹P NMR monitoring of the reaction of [Ru(PPh₃)₃Cl₂]·PPh₃ and ZnMe₂ showed that the formation of 1 proceeded through two sets of intermediates (Fig. 2). One set formed very early in the reaction and was identified at low temperature by NMR spec-

that of the major diastereomer only ever appeared as a broad

troscopy. The second set appeared later in the reaction and proved amenable to room temperature spectroscopic scrutiny.

Characterisation of these two sets of intermediates (see below) led us to the mechanistic hypothesis depicted in Scheme 3. The initial addition of ZnMe₂ to [Ru(PPh₃)₃Cl₂]·PPh₃ gives the 'early' intermediates **I–III**, which all feature two *ortho*-metallated PPh₃ ligands (step i). Further reaction with ZnMe₂, followed by C–C coupling, ¹⁰ generates the late intermediates **IV–VI** (step ii) which contain 2,2'-bis(diphenylphosphino)biphenyl (BIPHEP) ligands. A formal P–C/Ru–C metathesis reaction¹¹ involving BIPHEP and PPh₂(C₆H₄) ligands in step iii¹² ultimately yields **1**. ¹³ Support for the formation of BIPHEP containing species on the mechanistic pathway was provided by the reaction of ZnMe₂ with an *in situ* generated sample of [Ru(BIPHEP)(PPh₃)HCl] (Scheme 3, step iv) which produced NMR signals for **IV–VI**, as well as the final product **1** (ESI‡).

Characterisation of intermediates I-VI

A low temperature (246 K) reaction of ZnMe₂ and [Ru(PPh₃)₃Cl₂]·PPh₃ generated intermediates **I-III**, which appeared in the form of three very broad ³¹P NMR signals at δ 51, -27 and -39. As shown in Fig. 3, these resolved into five low and four higher frequency resonances at 210 K. Intermediates **I-III** were assigned as bis-cyclometallated

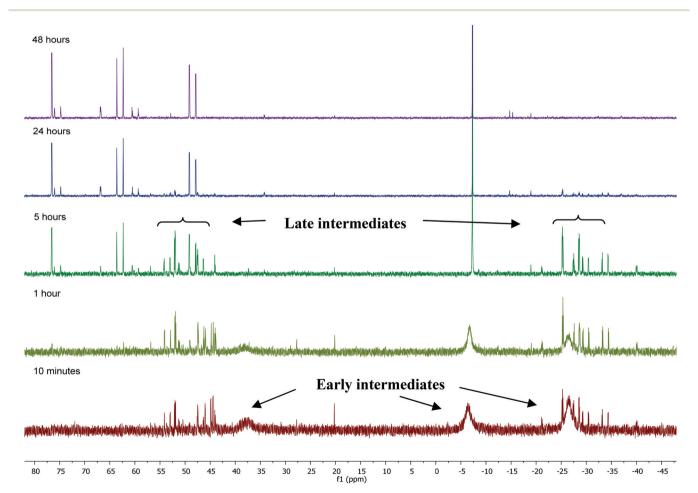

Fig. 2 $^{31}P\{^{1}H\}$ NMR spectra (202 MHz, THF- d_8 , 298 K) showing the progress of the reaction between [Ru(PPh₃)₃Cl₂]·PPh₃ and ZnMe₂ with time.

species (Scheme 4) based on the number of resonances, their chemical shifts (the low frequency signals are diagnostic of four-membered ring cyclometallated species)^{9,14} and ³¹P COSY measurements (ESI ‡). Geometries were based upon the magnitudes of $^2J_{\rm PP}$. The pale yellow colour of the reaction mixture (*cf.* the red colour of 1) supports I–III being coordinatively satu-

Scheme 5 Proposed structures for intermediates IV-VI.

rated, although the exact nature of the two-electron donor X in species I remains unknown; ZnMe2, ZnMeCl or THF are the most likely candidates. 15 The intermediates I-III were present in a ratio of ca. 3.5:5.5:1 and were shown to be in exchange by ³¹P{¹H} EXSY measurements.

The formation of a second set of intermediates IV-VI was established in a separate experiment in which a 1:5 molar

Scheme 6 Formation of [Ru(dppbz)(PPh2(binaphthyl)')ZnMe] (3).

ratio of [Ru(PPh3)3Cl2]·PPh3 and ZnMe2 were combined at room temperature. Tellingly, IV and V each showed just a single cyclometallated ³¹P{¹H} NMR resonance, together with two other higher frequency signals (ESI[†]). We propose that IV and V must also contain ZnMe ligands in order to remain as Ru(II). Structures consistent with these data are shown in Scheme 5, although NMR spectra do not allow them to be differentiated. The identity of VI was more straightforward given the presence of one high and two low frequency ³¹P{¹H} resonances, and a doublet of triplets hydride resonance $(\delta - 8.05 \text{ ppm}, {}^{2}J_{HP} = 46.8 \text{ Hz}, {}^{2}J_{HP} = 13.4 \text{ Hz}; \text{ ESI}^{+}_{+}). \text{ VI is}$ related to IV and V by an additional cyclometallation reaction. The proposed structures of the three intermediates were based upon a comparison of chemical shifts and coupling constants to triphenylphosphine derivatives formed in the reaction of [Ru(PPh₃)₃HCl] with ZnMe₂.⁵

Synthesis and characterisation of [Ru(dppbz) (PPh₂(binaphthyl)')ZnMe] (3)

Given the reactivity of [Ru(BIPHEP)(PPh3)HCl] (Scheme 3), ZnMe2 was added to the racemic BINAP derivative [Ru(rac-BINAP)(PPh₃)HCl] (rac-BINAP = racemic(2,2'-bis(diphenylphosphino)-1,1'-binaphthyl).16 An instantaneous colour change from red-orange to deep green was observed, 17 which reverted back to red upon heating at 70 °C (24 h). ³¹P{¹H} NMR spectroscopy (ESI[‡]) showed the presence of two new species in a 1:1 ratio, both of which exhibited three high frequency doublet of doublet resonances (δ 77, 69, 63; δ 79, 68, 53). The signals were assigned to two diastereomers (vide infra for crystallographic confirmation) of [Ru(dppbz)(PPh2(binaphthyl)') ZnMe] (3, Scheme 6). In contrast to 1, the diastereomers did not exchange by ³¹P EXSY (ESI‡).

Compound 3 exhibited a broadly analogous structure to 1 (Fig. 4), in terms of the co-ordination geometry about the central ruthenium, 18,19 however, the square based pyramid

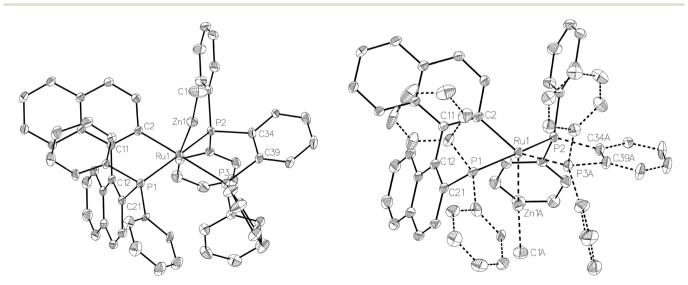

Fig. 4 Molecular structure of the two, mutually disordered, diastereomers present in the structure of 3, from approximately similar viewpoints. Ellipsoids are represented at 30% probability. Hydrogen atoms and guest solvent have been omitted for clarity.

Dalton Transactions Paper

was substantially less distorted than that in 1, as evidenced by maximum deviations of +0.17 Å and -0.087 Å for Ru1 and P3, respectively, either side of the mean-plane containing the ruthenium centre, the three P atoms and the cyclometallated carbon. The Ru-Zn distance was even further reduced in 3 compared to 1 (to 2.2867(6) Å), although the two Ru-C_{metallated} bond lengths were similar in both cases (1: 2.111(2) Å; 3: 2.120(2) Å). Both of these values are noticeably longer than the equivalent metric of 2.051(4) Å reported for a cycloruthenated Cy₂P(binaphthyl)' ligand. 18 The crystal structure of 3 was heavily disordered such that the asymmetric unit contains an overlay of two diastereomers (Fig. 4). The two components (53:47 occupancy ratios) are related by an approximate (noncrystallographic) mirror which bisects the P3-Ru1-P3A angle. As the disorder only impacts, in a minor way, on the asymmetric ligand that contains atom P1, the disordered fractions are not mirror images of each other.

Reactivity of 1 with H2 and PhC=CH

The presence of both unsaturated Ru and Zn centres afforded an opportunity to compare the reactivity of 1 with that previously reported for A and E (summarised in Scheme 7). 2,3,20

The addition of 1 atm H_2 to a toluene- d_8 solution of 1 brought about an instantaneous change from the red colour of the coordinatively unsaturated starting material to colourless, again indicative of coordinatively saturated Ru. Three new broad, low frequency hydride resonances were present in the ¹H NMR spectrum of the reaction mixture. Cooling to 246 K partially resolved these signals and showed they were present in a 1:1:1 ratio (ESI;). Together with the 31P{1H} resonances

Scheme 7 Summary of the reactions of [Ru(IPr)₂(CO)ZnMe]⁺ and [Ru(IMes)'(PPh₃)(CO)(ZnMe)] with H₂.

 $(\delta 86 \text{ (dd, }^2 J_{PP} = 242, 24 \text{ Hz}), 81 \text{ (t, }^2 J_{PP} = 25 \text{ Hz}), 58 \text{ (dd, }^2 J_{PP} =$ 242, 26 Hz); ESI‡), these data are consistent with the formation of mer-[Ru(dppbz)(Ph₂P(biphenyl))(H)₂(H)(ZnMe)] (4), arising through a reaction with two equivalents of H₂. One equivalent added across the Ru-Zn bond to afford a Ru(H)2Zn moiety, while the second added across the Ru-C bond to reverse the cyclometallation of the Ph₂P(biphenyl)' ligand, also generating a terminal Ru-H ligand in the process (Scheme 8).

Complex 1 also reacted with two molecules of PhC≡CH (Scheme 8) to form the structurally characterised mer-isomer $[Ru(dppbz)(Ph_2P(biphenyl))(C \equiv CPh)_2(H)(ZnMe)]$ Compound 5 results from C-H activation of one equivalent of alkyne across the Ru-Zn bond,21 together with C-H activation of a second equivalent, leading to reversal of biphenyl group cyclometallation and generation of a terminal Ru-acetylide ligand. The X-ray structure (Fig. 5) revealed several features worthy of comment. The Zn atom was asymmetrically bound to the μ - η^2 : η^1 -C=CPh ligand, with Zn(1)-C(2) and Zn(1)-C(3) distances of 2.1123(17) Å and 2.4415(18) Å, respectively. These differences mirror what is seen in the few other examples of compounds in which there is an apparent side-on interaction involving zinc and a C≡C bond. 22,23 Similarly, the interaction

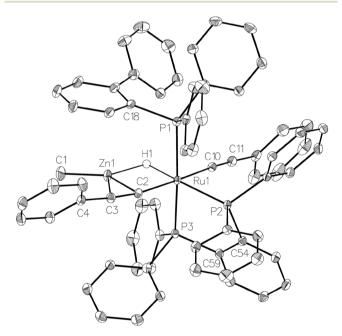

Fig. 5 Molecular structure of 5. Ellipsoids are represented at 30% probability. Guest solvent and hydrogen atoms, with the exception of H1, have been omitted for clarity.

Scheme 8 Reactivity of 1 with H₂ and PhC≡CH.

with zinc led to a slightly less linear Ru–C \equiv C unit (167.83°) than in the terminal acetylide ligand (175.11°). The two C \equiv C distances were similar within 3σ . The presence of two different acetylide groups was also apparent from the presence of two C \equiv C vibrations (2082, 2012 cm⁻¹)²² in the IR spectrum.

Both 4 and 5 displayed only limited stability, slowly degrading over time in solution (5 also slowly degraded in the solid-state) at room temperature.

Conclusions

Paper

In contrast to the 'simple' Ru-Zn products A, D and E (Scheme 1) which are formed upon addition of ZnMe2 to [Ru $(NHC)_2(CO)H^{\dagger}$ (NHC = IPr, IBiox) and $[Ru(NHC)(PPh_3)(CO)HCl]$ (NHC = IMes), [Ru(PPh₃)₃Cl₂] reacts through a series of C-H activation, C-C coupling, P-C activation and P-C bond forming steps to give [Ru(dppbz)(PPh₂(biphenyl)')(ZnMe)] (1). Although the individual reactions involved in the overall transformation of three PPh₃ ligands into Ph₂PC₆H₄PPh₂ and Ph₂P(biphenyl) groups have been observed separately,11 to the best of our knowledge, there are no examples in which they have been observed in concert with one another. The role of ZnMe2 is central to the observation of the chemistry, as it provides a means to bring about the elimination of both CH₄ and ZnMeCl, allowing access to highly reactive, low-valent ruthenium fragments capable of performing the array of bond activation/formation steps observed. Additional studies of novel Ru-Zn heterobimetallic complexes that highlight this even further will be reported in due course.

Experimental

All manipulations were carried out using standard Schlenk, high vacuum and glovebox techniques. Solvents were purified using an MBraun SPS solvent system (hexane, Et₂O) or under a nitrogen atmosphere from sodium benzophenone ketyl (benzene, THF). C_6D_6 , toluene- d_8 and THF- d_8 were vacuum transferred from potassium. CD2Cl2 was dried over CaH2. NMR spectra were recorded on Bruker Avance 400 and 500 NMR spectrometers at 298 K (unless stated otherwise) and referenced as follows; ¹H: chemical shifts of residual protio solvent resonances (C_6D_6 δ 7.16, THF- d_8 δ 3.58, CD_2Cl_2 δ 5.32, $C_6D_5CD_3$ δ 2.08); ¹³ $C_7^{1}H_7^{1}$: solvent signal for $C_6D_5CD_3$ (δ 20.4); $^{31}P\{^{1}H\}$: externally to 85% $H_{3}PO_{4}$ (δ 0.0). IR spectra were recorded in C₆D₅CD₃ solution or in KBr discs on a Nicolet Nexus spectrometer. Elemental analyses were performed by Elemental Microanalysis Ltd, Okehampton, Devon, UK. Literature methods were used to prepare [Ru(PPh₃)₃Cl₂]·PPh₃, ^{6a,24} [Ru(PPh₃)₃Cl₂], ²⁴ and [Ru(PPh₃)₃HCl]·toluene.²⁵ Racemic [Ru(rac-BINAP)(PPh₃)HCl]· 0.35BINAP was prepared by an analogous process to that described for [Ru(R-BINAP)(PPh₃)HCl].¹⁶

[Ru(dppbz)(PPh₂(biphenyl)')ZnMe] (1)

ZnMe₂ (1.25 mL of 2.0 M toluene solution, 2.5 mmol) was added to a THF (25 mL) suspension of [Ru(PPh₃)₃Cl₂]·PPh₃

(610 mg, 0.5 mmol) and the mixture stirred for 42 h. After removal of the solvent and residual ZnMe2 under vacuum, the red residue was redissolved in THF (10 mL), filtered and the filtrate layered with hexane (14 mL). A red crystalline solid was collected, washed with Et2O (6 mL) and dried under vacuum. Yield: 230 mg (48%). Employing [Ru(PPh₃)₃Cl₂] as the precursor gave 236 mg of the title product as a red solid (49% yield). 1 exists in solution as an equilibrium mixture of 2 diastereomers in a 5:1 ratio (referred to as maj and min below). ¹H NMR: $\delta_{\rm H}$ (500 MHz, C_6D_6) 7.71–7.62 (m, $1H_{\rm maj}$, $1H_{\rm min}$, Ar), 7.62-7.53 (m, 5H_{maj}, 5H_{min}, Ar), 7.51-7.19 (m, 9H_{maj}, 9H_{min}, Ar), 7.12-6.71 (m, $24H_{\text{maj}}$, $26H_{\text{min}}$, Ar), 6.68 (t, J = 7.5 Hz, $2H_{\text{maj}}$, Ar), 6.62 (t, J = 7.3 Hz, $1H_{\text{maj}}$, Ar), 6.34 (t, J = 7.2 Hz, 1H_{min}, Ar), 0.08 (s, 3H_{min}, ZnCH₃), -1.00 (s, 3H_{maj}, ZnCH₃). ³¹P{¹H} NMR: δ_P (202 MHz, C₆D₆) 79.1 (dd, ² J_{PP} = 18, 3 Hz, dppbz_{maj}), 77.6 (dd, ${}^{2}J_{PP}$ = 250, 7 Hz, dppbz_{min}), 68.9 (dd, ${}^{2}J_{PP}$ = 18, 7 Hz, dppbz_{min}), 65.3 (dd, ${}^{2}J_{PP}$ = 257, 3 Hz, dppbz_{mai}), 62.0 (dd, ${}^{2}J_{PP}$ = 250, 18 Hz, PPh₂(biphenyl)'_{min}), 50.6 (dd, ${}^{2}J_{PP}$ = 257, 18 Hz, PPh₂(biphenyl)'_{maj}). Anal. Calcd for C₅₅H₄₅P₃ZnRu: C, 68.43, H, 4.70%; Found: C, 67.89, H, 4.84%.

[Ru(dppbz)(PPh₂(biphenyl)')(CO)ZnMe] (2)

A J. Young's resealable NMR tube was charged with 1 (10 mg, 0.01 mmol) in C₆D₅CD₃ (0.5 mL), and placed under 1 atm CO (or ¹³CO). Vigorous shaking brought about a colour change from deep red to pale yellow and complete dissolution of starting material was achieved within a few minutes. The solution was analysed by ¹H and ³¹P{¹H} NMR spectroscopy, which showed that 2 was present as a mixture of 2 diastereomers in a ratio of ca. 1.3:1 (referred to as maj and min below). Selected ¹H NMR: $\delta_{\rm H}$ (400 MHz, C₆D₅CD₃, 223 K) -0.52 (s, ZnCH_{3maj}), -1.54 (s, ZnCH_{3min}). ³¹P{¹H} NMR: δ_P (162 MHz, C₆D₅CD₃, 223 K) 75.0 (dd, ${}^{2}J_{PP}$ = 241, 12 Hz, dppbz_{maj}), 68.1 (d, ${}^{2}J_{PP}$ = 18 Hz, dppbz_{min}), 68.0 (d, ${}^{2}J_{PP}$ = 241 Hz, dppbz_{min}), 58.7 (t, ${}^{2}J_{PP}$ = 15 Hz, dppbz_{maj}), 48.6 (dd, ${}^{2}J_{PP}$ = 241, 18 Hz, $PPh_2(biphenyl)'_{min}$, 46.3 (dd, ${}^2J_{PP} = 241$, 18 Hz, PPh₂(biphenyl)'_{maj}). 2-¹³CO: Selected 13 C{ 1 H} NMR: $\delta_{\rm C}$ (101 MHz, C₆D₅CD₃, 223 K) 208.7 (m, RuCO_{maj}), 203.9 (q, ${}^{2}J_{PC} = 8$ Hz, RuCO_{min}). ${}^{31}P\{{}^{1}H\}$ NMR: δ_{P} (162 MHz, $C_6D_5CD_3$, 223 K) 75.0 (dt, ${}^2J_{PP}$ = 242, 11 Hz, ${}^2J_{PC}$ = 11 Hz, dppbz_{maj}), 68.1 (dd, ${}^{2}J_{PP}$ = 18 Hz, ${}^{2}J_{PC}$ = 7 Hz, dppbz_{min}), 68.0 (dd, ${}^{2}J_{PP}$ = 241 Hz, ${}^{2}J_{PC}$ = 7 Hz, dppbz_{min}), 58.7 (m, dppbz_{maj}), 48.6 (ddd, ${}^{2}J_{PP} = 241$, 18 Hz, ${}^{2}J_{PC} = 8$ Hz, $PPh_{2}(biphenyl)'_{min}$, 46.3 (ddd, ${}^{2}J_{PP} = 242$, 18 Hz, ${}^{2}J_{PC} = 11$ Hz, PPh₂(biphenyl)'_{mai}). IR (C₆D₅CD₃, cm⁻¹): 1934 (ν_{CO}), 1911 (ν_{CO}).

Detection and characterisation of intermediates I-III

ZnMe₂ (42 μ L of 1.2 M toluene solution, 0.05 mmol) in THF- d_8 (0.2 mL) was vacuum transferred into a J. Young's resealable NMR tube containing a THF- d_8 (0.3 mL) solution of [Ru(PPh₃)₃Cl₂]·PPh₃ (12 mg, 0.01 mmol). The solution was maintained at <200 K prior to insertion into a pre-cooled (210 K) NMR spectrometer. After warming to 246 K for 15 min to initiate reaction, the temperature was returned to 210 K to prevent further reaction and ¹H, ³¹P{¹H}, ³¹P COSY and ³¹P EXSY measurements of intermediates **I–III** recorded. The

Dalton Transactions Paper

reaction mixture was then warmed to room temperature. After 8 h, ³¹P{¹H} NMR spectroscopy revealed the formation of intermediates IV-VI (see below), as well as the final product 1. ³¹P $\{^{1}H\}$ NMR of I: δ_{P} (162 MHz, THF- d_{8} , 210 K) 51.5 (dd, $^{2}J_{PP}$ = 292, 14 Hz), -26.5 (br s), -39.6 (br d, ${}^{2}J_{PP} = 290$ Hz). ${}^{31}P\{{}^{1}H\}$ NMR of II: δ_P (162 MHz, THF- d_8 , 210 K) 44.5 (ddd, ${}^2J_{PP}$ = 265, 18, 9 Hz), 27.1 (q, ${}^{2}J_{PP}$ = 19 Hz), -38.0 (td, ${}^{2}J_{PP}$ = 19, 10 Hz), -47.5 (dt, ${}^{2}J_{PP} = 266$, 19 Hz). ${}^{31}P\{{}^{1}H\}$ of III: δ_{P} (162 MHz, THF d_8 , 210 K) 24.4 (t, ${}^2J_{PP}$ = 16 Hz), -39.7 (t, ${}^2J_{PP}$ = 16 Hz).

Detection and characterisation of intermediates of IV-VI

A J. Young's resealable NMR tube was charged with $[Ru(PPh_3)_3Cl_2]\cdot PPh_3$ (12 mg, 0.01 mmol) in THF- d_8 (0.5 mL) and ZnMe₂ (42 µL of 1.2 M toluene solution, 0.05 mmol) was added. After standing for 3.5 h at room temperature, ¹H, ³¹P{¹H}, ³¹P HMQC and ³¹P COSY measurements were used to characterise the three intermediates **IV-VI**. ³¹P{¹H} NMR of **IV**: $\delta_{\rm P}$ (202 MHz, THF- $d_{\rm 8}$) 55.4 (dd, ${}^2J_{\rm PP}$ = 240, 15 Hz), δ 49.4 (dd, $^{2}J_{PP}$ = 20, 15 Hz), -31.9 (dd, $^{2}J_{PP}$ = 240, 20 Hz). $^{31}P\{^{1}H\}NMR$ of V: $\delta_{\rm P}$ (202 MHz, THF- $d_{\rm 8}$) 48.8 (dd, $^2J_{\rm PP}$ = 234, 18 Hz), 45.9 (dd, $^{2}J_{PP}$ = 22, 18 Hz), -28.0 (dd, $^{2}J_{PP}$ = 234, 22 Hz). Selected ^{1}H NMR of VI: $\delta_{\rm H}$ (500 MHz, THF- d_8) -8.05 (dt, $^2J_{\rm HP}$ = 46.8, 13.4 Hz, 1H, RuH). $^{31}P\{^{1}H\}$ NMR of VI: δ_{P} (202 MHz, THF- d_{8}) δ 53.9 $(dd, {}^{2}J_{PP} = 24, 21 \text{ Hz}), -23.4 (dd, {}^{2}J_{PP} = 21, 19 \text{ Hz}), -26.7 (dd,$ $^{2}J_{PP} = 24, 19 \text{ Hz}$).

Reaction of [Ru(BIPHEP)(PPh3)HCl] and ZnMe2

[Ru(BIPHEP)(PPh₃)HCl] was prepared in situ upon heating (40 °C, 24 h) [Ru(PPh₃)₃HCl]·toluene (10 mg, 0.01 mmol) and BIPHEP (5 mg, 0.01 mmol) in CD₂Cl₂ (0.6 mL). The resulting red-orange solution comprised ca. 80% [Ru(BIPHEP)(PPh₃) HCl], together with [Ru(PPh₃)₃HCl] (ca. 12%) and a third species attributed to [Ru(BIPHEP)2HCl] (ca. 8%). After removal of solvent, the red residue was redissolved in THF- d_8 (0.5 mL) and ZnMe₂ (42 µL of 1.2 M toluene solution, 0.05 mmol) added. A ³¹P{¹H} NMR spectrum recorded 6 h later showed the presence of intermediates IV-VI, along with 1. Selected ¹H NMR of [Ru(BIPHEP)(PPh₃)HCl]: $\delta_{\rm H}$ (500 MHz, CD₂Cl₂) -22.78 (dt, ${}^{2}J_{HP} = 37$, 23 Hz, 1H, RuH). ${}^{31}P\{{}^{1}H\}$ NMR of [Ru(BIPHEP)(PPh₃)HCl]: $\delta_{\rm P}$ (202 MHz, CD₂Cl₂) 87.0 (dd, ${}^2J_{\rm PP}$ = 38, 21 Hz), 41.2 (dd, ${}^{2}J_{PP}$ = 305, 38 Hz), 35.5 (dd, ${}^{2}J_{PP}$ = 305, 21 Hz). Selected ¹H NMR of [Ru(BIPHEP)₂HCl]: $\delta_{\rm H}$ (500 MHz, CD_2Cl_2) -16.47 (tt, ${}^2J_{HP}$ = 24, 15 Hz, 1H, RuH). ${}^{31}P\{{}^{1}H\}$ NMR of [Ru(BIPHEP)₂HCl]: δ_P (202 MHz, CD₂Cl₂) 35.8 (t, $^2J_{PP}$ = 35 Hz), 22.2 (t, ${}^{2}J_{PP}$ = 35 Hz).

[Ru(dppbz)(PPh₂(binaphthyl)')ZnMe] (3)

ZnMe₂ (0.50 mL of 1.2 M toluene solution, 0.6 mmol) was added to a THF (6 mL) suspension of racemic [Ru(rac-BINAP) (PPh₃)HCl]·0.35BINAP (120 mg, 0.10 mmol), leading to an immediate colour change from red-orange to deep green. The solution was then heated for 24 h at 70 $^{\circ}\text{C}.$ After removal of the solvent, the red residue was redissolved in THF (1.5 mL), filtered through a pad of Celite® and the filtrate treated with hexane (3 mL). After standing for 24 h, free BINAP was separated by filtration through Celite® and a further 1 mL hexane

added to the filtrate to give, over 24 h, a red crystalline solid, which was isolated and dried under vacuum. Yield: 58 mg, ca. 90% pure (49% yield). A sample of the product (20 mg) was recrystallised from THF/hexane to give 15 mg of pure material. 3 exists as a mixture of two diastereomers (referred to as A and B below) in a ratio of ca. 1:1 ratio. These were assigned by comparison with the NMR signals of minor and major diastereomers of 1. ¹H NMR: $\delta_{\rm H}$ (500 MHz, C_6D_6) 7.96 (d, J = 8.5 Hz, 1H, Ar), 7.82 (t, J = 8.5 Hz, 2H, Ar), 7.73–7.34 (m, 25H, Ar), 7.33-7.18 (m, 5H, Ar), 7.15-6.82 (m, 39H, Ar), 6.81-6.68 (m, 10H, Ar), 6.67–6.49 (m, 8H, Ar), 6.23 (t, J = 7.1 Hz, 2H, Ar), 0.15 (s, $3H_A$, $ZnCH_3$), -1.40 (s, $3H_B$, $ZnCH_3$). $^{31}P\{^{1}H\}$ NMR: δ_P (202 MHz, C_6D_6) 78.5 (dd, ${}^2J_{PP}$ = 18, 3 Hz, dppbz_B), 77.1 (dd, $^{2}J_{PP} = 248$, 11 Hz, dppbz_A), 68.6 (dd, $^{2}J_{PP} = 17$, 11 Hz, dppbz_A), 68.2 (dd, ${}^{2}J_{PP}$ = 255, 3 Hz, dppbz_B), 63.4 (dd, ${}^{2}J_{PP}$ = 248, 17 Hz, $PPh_2(binaphthyl)'_A)$, 52.8 (dd, ${}^2J_{PP} = 255$, 18 Hz, $PPh_2(binaphthyl)'_B$). Anal. Calcd for $C_{63}H_{49}P_3ZnRu$: C, 71.02; H, 4.64%; Found: C, 71.25; H, 5.05%.

[Ru(dppbz)(Ph₂P(biphenyl))(H)₂(H)(ZnMe)] (4)

A J. Young's resealable NMR tube was charged with 1 (10 mg, 0.01 mmol) in C₆D₅CD₃ (0.5 mL) and placed under 1 atm H₂. Vigorous shaking brought about a colour change from deep red to pale yellow. Complete dissolution of starting material took place in <10 min. The resulting fine suspension was filtered through a pad of Celite® and rapidly (<30 min) analysed by ¹H and ³¹P{¹H} NMR spectroscopy, which showed clean formation of 4. Slow decomposition of the product took place in solution at room temperature, precluding isolation. ¹H NMR: $\delta_{\rm H}$ (400 MHz, C₆D₅CD₃, 246 K) 8.54 (t, J = 9.0 Hz, 2H, Ar), 8.15 (dd, J = 12.5, 8.2 Hz, 1H, Ar), 7.99 (t, 8.5 Hz, 2H, Ar), 7.57-7.37 (m, 6H, Ar), 7.36-6.92 (m, 16H, Ar; overlapped with residual solvent signals in C₆D₅CD₃), 6.91-6.80 (m, 6H, Ar), 6.79-6.65 (m, 8H, Ar), 6.59 (t, J = 7.2 Hz, 2H, Ar), -0.89 (s, 3H, ZnCH₃), -7.08 (quint, ${}^{2}J_{HP} = 8.9$ Hz, 1H, RuH), -8.37 (dt, ${}^{2}J_{HP} =$ 52.1 Hz, 19.4 Hz, 1H, RuH), -8.62 (m, 1H, RuH). ³¹P{¹H} NMR: $\delta_{\rm P}$ (162 MHz, C₆D₅CD₃, 246 K) 85.5 (dd, ${}^2J_{\rm PP}$ = 242, 24 Hz), 81.2 $(t, {}^{2}J_{PP} = 25 \text{ Hz}), 57.9 \text{ (dd, } {}^{2}J_{PP} = 242, 26 \text{ Hz}).$

$[Ru(dppbz)(Ph_2P(biphenyl))(C \equiv CPh)_2(H)(ZnMe)]$ (5)

A suspension of 1 (97 mg, 0.1 mmol) in C₆H₆ (2 mL) was treated with PhC≡CH (33 µL, 0.3 mmol) and the mixture stirred vigorously for 3 h. The resulting yellow fine suspension was filtered through a pad of Celite®, diluted with hexane (7.5 mL) and crystallized at -35 °C. Yellow crystalline solid was separated, washed with hexane (1.5 mL \times 2) and dried under vacuum. Yield: 106 mg (90%). The product undergoes slow decomposition both in solution and in the solid-state at room temperature. ¹H NMR: $\delta_{\rm H}$ (500 MHz, C₆D₆) 8.76 (dd, J = 13.8, 8.0 Hz, 1H, Ar), 8.62 (t, J = 9.1 Hz, 2H, Ar), 8.20 (br t, J = 8.3 Hz, 2H, Ar), 7.66 (t, J = 7.3 Hz, 1H, Ar), 7.57 (t, J = 7.6 Hz, 1H, Ar), 7.44-7.29 (m, 6H, Ar), 7.22 (d, J = 7.4 Hz, 2H, Ar), 7.19-6.60 (m, 38H, Ar), -0.47 (s, 3H, ZnCH₃), -6.91 (dt, ${}^{2}J_{HP} = 59.6$, 16.2 Hz, 1H, RuH). $^{31}P\{^{1}H\}$ NMR: δ_{P} (202 MHz, $C_{6}D_{6}$) 73.8 (dd, $^{2}J_{PP}$ = 275, 20 Hz), 55.8 (dd, ${}^{2}J_{PP} = 24$, 20 Hz), 37.9 (dd, ${}^{2}J_{PP} = 275$, 24 Hz). IR (KBr, cm⁻¹): 2082 (ν C \equiv C), 2012 (ν C \equiv C). Anal.

Calcd for $C_{71}H_{57}P_3ZnRu$: C, 72.91; H, 4.91%; Found: C, 73.03; H, 4.89%.

X-ray crystallography

Paper

Data for 1 were collected on an Agilent Xcalibur diffractometer (using Mo-K α radiation) while those for 3 and 5 were obtained using an Agilent SuperNova instrument and a Cu-K α source. All experiments were conducted at 150 K. Using Olex2, ²⁶ all structures were solved with the olex2-solve²⁷ structure solution program and subsequently refined using the SHELXL program. ²⁸

Points of note include the fact that the asymmetric unit in 1 contains a portion of solvent in addition to one molecule of the complex. While the former was identifiable as a hexane moiety, the disorder was so extensive that modelling would have resulted in excessive parameterization. Hence, the solvent was treated using the solvent mask in Olex2. However, the formula as presented, herein, accounts for the presence of a 1:1 ratio of the title compound to hexane in the crystal.

The asymmetric unit in 3 resolved beautifully, once the rampant disorder was addressed. In particular, Zn1, P3, the methyl group based on C1 and the phenyl groups based on C34, C40, C41, C45 and C58 were all treated for 53:47 disorder. Some distance and ADP restraints were included in the model (on merit), in disordered regions - to assist convergence. There was also a modicum of disordered solvent in the asymmetric unit, which did not lend itself to being readily modelled. As above, this was treated with the solvent mask algorithm available in Olex2, and an allowance for one molecule of THF per unit cell has been made in the formula as presented - to account for the pre-squeeze electron density evident in the difference Fourier electron density map. It merits note that strenuous checks were performed regarding the diffraction pattern symmetry in this structure, given the level of disorder present. Integration of the data in the triclinic, reduced cell [a = 10.8687(3), b = 12.1871(3), c =20.5157(5) Å, $\alpha = 79.451(2)$, $\beta = 81.396(2)$, $\gamma = 80.252(2)^{\circ}$ afforded two molecules in the asymmetric unit (as expected) in P1 plus some solvent. Both of the complex molecules exhibited similar disorder to that presented for the Pbca solution/ refinement reported herein. Ultimately, the exercise of testing in space-group P1 served as reassurance that the evident disorder is real. H1 in the structure of 5 was located and refined freely. Three guest molecules of benzene were also found in the asymmetric unit for this crystal.

Crystallographic data for all compounds have been deposited with the Cambridge Crystallographic Data Centre as supplementary publications CCDC 1937663–1937665 for 1, 3 and 5, respectively.

Conflicts of interest

There are no conflicts of interest to declare.
