# Palladium-catalyzed intramolecular $\mathrm{C}-\mathrm{H}$ arylation of 2-halo- N -Boc- N -arylbenzamides for the synthesis of $\mathrm{N}-\mathrm{H}$ phenanthridinones $\dagger$ 

Quan-Fang Hu, (D) Tian-Tao Gao, Yao-Jie Shi, Qian Lei and Luo-Ting Yu (D)*

A palladium catalyzed synthesis of $\mathrm{N}-\mathrm{H}$ phenanthridinones was developed via $\mathrm{C}-\mathrm{H}$ arylation. The protocol gives phenanthridinones regioselectively by one-pot reaction without deprotection. It exhibits broad substrate scope and affords targets in up to $95 \%$ yields. Importantly, it could be applied for the less reactive o-chlorobenzamides.

## Introduction

Palladium-catalyzed direct functionalization of C-H bonds has become one of the most efficient and environmentally friendly mild procedures for building carbon-carbon bonds. ${ }^{1}$ It holds a special place among various types of palladium-catalyzed coupling reactions. C-H direct arylation is its typical application, which is catalyzed by $\operatorname{Pd}(0)$ or $\operatorname{Pd}(\mathrm{II})$ with phosphine ligands operating under a $\operatorname{Pd}(0) / \operatorname{Pd}($ II $)$ or $\operatorname{Pd}(\mathrm{II}) / \mathrm{Pd}($ IV $)$ catalytic cycle with or without the assistance of base. ${ }^{2}$ This coupling strategy has been well developed in terms of regioselectivity and efficiency; the tolerance of diverse functional groups makes the $\mathrm{C}-\mathrm{H}$ arylation particularly versatile for organic synthesis. The starting materials may be easily achieved and thus this strategy has been used for building a variety of aromatic and heteroaromatic systems. ${ }^{3}$

Phenanthridinones are important structural units found in many natural products and pharmaceuticals that exhibit wide range of biological activities. ${ }^{4}$ A variety of novel synthetic approaches have been developed to the synthesis of the phenanthridinone cores and related lactams, most of them are based on palladium catalyzed biaryl coupling by the regioselective C-H bond activation (Scheme 1a, synthesis of $N$-alkyl phenanthridinones). ${ }^{5}$ Although they are effective for synthesis of $N$-alkyl phenanthridinones, the obvious drawbacks were observed when applied to $N-H$ phenanthridinones. ${ }^{5 e, 6}$ Their scope of substrates is quite limited and high reaction temperature is necessary. To the best of our knowledge, only the yields with iodo-substituted anilides are reported. Usually a complex mixture of side-products is observed, decreasing the yield of

[^0]desired product. ${ }^{6 a, 6 b}$ This is possibly resulted from the coordination of nitrogen to palladium in the presence of the NH free amide. ${ }^{5 e}$ Earlier reported efficient protocols for such analog were mediated by potassium tert-butoxide ${ }^{7}$ or photochemistry. ${ }^{8,9}$ However, those procedures are not regioselective with substituted anilides due to radical cyclization mechanism (Scheme 1b, radical pathway for synthesis of $\mathrm{N}-\mathrm{H}$ phenanthridinones), limiting application of substrate scopes. ${ }^{7}$ So based on those disadvantages researchers reported utilization of protection groups which could be easily cleaved after the ring closure. Sandro Cacchi and co-workers ${ }^{5 e}$ developed $N$-benzyl derivatives of $N$-benzoyl- $O$-iodoanilides which can be converted

Scheme 1 Synthesis of phenanthridinones via intramolecular cyclization.

Scheme 2 Synthesis of cyclization substrates.
into the corresponding phenanthridinones in good to high yields, but needed one more deprotection step in TFA. François Tillequin et al. ${ }^{6 d}$ developed Boc as protection and leaving group, however, one equivalent of Pd catalyst and two equivalents of phosphine ligands were involved, and only $26 \%$ yield was obtained.

In this account it is important to develop an operationally simple catalyst system for direct intramolecular arylation processes exhibiting broad scope for aryl chlorides, bromides, and iodides. Here we disclosed a palladium catalyzed one pot $\mathrm{C}-\mathrm{H}$ activation protocol, cyclization and decarboxylation of N Boc protected $o$-halobenzamides to produce phenanthridinones directly, which gave good to excellent yields as high as $95 \%$ (Scheme 1c, synthesis of $\mathrm{N}-\mathrm{H}$ phenanthridinones by $\mathrm{C}-\mathrm{H}$
activation from Boc protected amide). It can be easily scaled up even with increasing of yield. The reaction was promoted by $\mathrm{Pd}\left(t-\mathrm{Bu}_{3} \mathrm{P}\right)_{2}$ combining together with KOAc, a convenient, commercial available catalyst inexpensive, but highly efficient to produce a broad range of phenanthridinones.

## Results and discussion

The synthesis of the amide starting material $\mathbf{4 x y}$ for this investigation is shown in Scheme 2. Ortho-halogen substituted arylcarboxylic acid was easily converted to acyl chloride, which reacted with aniline to give amide $3 x y$. Then under catalytic amount of DMAP in DCM, 3xy was almost quantitatively converted to $\mathbf{4 x y} .{ }^{10}$

In our initial investigation to optimize cyclization conditions of $\mathbf{4 x y}$, we selected $4 \mathbf{a a}$ as starting point for screening, which is briefly summarized in Table 1 . The $\mathrm{C}-\mathrm{H}$ direct arylation is strongly dependent on the catalyst, the solvent and the base. Firstly we tried most popular coupling catalyst/base system (entries 1-3), ${ }^{11}$ but obtained low yields; $\mathrm{Pd}(\mathrm{OAc})_{2} / \mathrm{Bu}_{3} \mathrm{P} / \mathrm{Ag}_{2} \mathrm{CO}_{3}$ system ${ }^{12}$ gave better yield (38\%). After that, we tried $\operatorname{Pd}\left(\mathrm{PCy}_{3}\right)_{2}$ under various basic conditions, and found the yield can be increased to $48 \%$ when KOAc was used. Speculating that different ligand could be used to fine-tune the reaction due to its electronic and steric particularities, ${ }^{2 d}$ we further screened $\mathrm{Pd}\left(t-\mathrm{Bu}_{3} \mathrm{P}\right)_{2}$ catalyst ${ }^{13}$ with different bases and finally identified $\operatorname{Pd}\left(t-\mathrm{Bu}_{3} \mathrm{P}\right)_{2} / \mathrm{KOAc}$ was the best combination (entry $11,72 \%$ yield). Other bases with different cation or anion were inferior (entries 9, 10). When the optimized condition was utilized with non-Boc protected substrate 3aa (entry 12), the strategy was not effective, suggesting that unprotected NH completely inhibited

${ }^{a}$ Reaction conditions: 1 mmol of substrate, 4 equiv. of KOAc, and $5 \%$ equiv. of $\mathrm{Pd}\left(t-\mathrm{Bu}_{3} \mathrm{P}\right)_{2}$ in 10 ml DMA were heated at $120{ }^{\circ} \mathrm{C}$ for 2 h under Ar atmosphere. ${ }^{b}$ Isolated yield. ${ }^{c}$ Reaction conducted at 20 mmol scale. ${ }^{d}$ Reacted at $135{ }^{\circ} \mathrm{C}$.
the reaction, presumably resulted by coordination of nitrogen to palladium in the presence of the NH free amide. ${ }^{5 e, 14}$

After optimization of the reaction condition, we attempted to extend the scope and generality of the intramolecular coupling as shown in Table 2. Various aryl acids and aryl amines were examined. Electron-rich groups (e.g. Me and OMe) either on the acid partner or on the aniline partner could smoothly undergo cyclization-decarboxylation which exclusively provided the desired products in 81-92\% yields (entries 1-5). Notably, naphthyl-based substrates $\mathbf{4 l b}$ and $\mathbf{4 l g}$ also gave good to excellent yields ( $75-95 \%$ ). 4lg gave lower yield due to slight electron deficiency. When this protocol was subjected to strong electrondeficient substrate such as cyano group ( $\mathbf{5 j h}$, entry 8 ), the yield reduced sharply. To explore the cyclization position with respect to meta-substituted anilines, we tested meta-isopropyl aniline (entry 9). The reaction gave para and ortho-cyclization mixtures (2:1); However when tert-butyl analine was tested (entry 10), only para-cyclization was produced, presumably due to stronger steric hindrance. It was worth noting that the 3 -amino thiophene also gave moderate to high yields (61-93\%, entries 1114), suggesting it's high $\mathrm{C}-\mathrm{H}$ activation activity and regioselectivity. NMR confirmed the coupling is at second position. The reaction scope is not limited to benzoic acids, thiophenecarboxylic acids could also go cyclization smoothly (entries 15-20) with aniline or aminothiophene. Similar to early Pdcatalyzated protocol, ${ }^{15}$ we found that pyridine ring was not an effective acid partner under our reaction condition (entries 2123). To further evaluation the protocol's scaling up efficiency, we tested $\mathbf{4 l b} / \mathbf{4 a f} / \mathbf{4 k c}$ as substrates for gram scale synthesis. To our delight, the yields increased up from $91 \% / 84 \% / 83 \%$ to $95 \% /$ $93 \% / 91 \%$ respectively.

Our above results showed that diverse functional groups, including $\mathrm{F}, \mathrm{Cl}, \mathrm{CN}, \mathrm{OMe}$, alkyl and a variety of aryl carboxylic acids and aryl amines were well tolerated. It leads us to speculate the reaction scope is not limited to bromo-substituted acid, but can also be extended to chloro-substituted acid. So we tested the activity of halogens in Table 3. Firstly, we selected the synthesis of 5aa as example (entries 1a to 1c). When iodide and bromide were tested, the reaction can be finished at $120{ }^{\circ} \mathrm{C}$, given $77 \%$ and $66 \%$ yield respectively. When chloride was utilized, the yield decreased to moderate (45\%) and must be conducted at higher temperature. After that, we tested electrondonating substitutes on either carboxylic moiety or aniline moiety (entries $2-5$ ) and found yield can be as high as $78 \%$; instead electron-withdrawing substitutes were negative to the reaction (entry $6,38 \%$ yield). When the reaction was extended to strong electron withdrawing substituents, the yield decreased significantly even with iodide (entry 9). Chloro-thiophene carboxylic acid also delivered the corresponding products without a problem (entries 7,8 ). Considering both chlorine and bromine were active as acid partner, we subjected 4uc for the reaction. Just as we predicted, the reaction turned to be quite messy and yielded no desired target (entry 10).

Next we examined the effect of catalyst loading to further optimize the reaction condition. Substrates 4lb and 4af were selected as examples which are shown in Table 4. Firstly we tested 4lb, when the catalyst loading increased from $5 \mathrm{~mol} \%$ to $6 \mathrm{~mol} \%$, the influence was insignificant. However, when it was reduced to $4 \mathrm{~mol} \%$, the starting material remained and the yield was reduced by $13 \%$; and only $60 \%$ yield was obtained when decreased further to $3 \mathrm{~mol} \%$; the same situation was observed with substrate 4 af . Based on research below, $5 \mathrm{~mol} \%$ catalyst was established as an optimal catalyst loading.

${ }^{a}$ Reaction conditions: 1 mmol of substrate, 4 equiv. of KOAc, and $5 \%$ equiv. of $\left(t-\mathrm{Bu}_{3} \mathrm{P}\right)_{2} \mathrm{Pd}$ in 10 ml DMA were heated at $135{ }^{\circ} \mathrm{C}$ for 2 h under Ar atmosphere. ${ }^{b}$ Isolated yield. ${ }^{c}$ Reacted at $120{ }^{\circ} \mathrm{C}$.

The directly cleavage of Boc was left for investigation for further exploring of reaction mechanism. We tested another protection group acetyl and used it for cyclization. However acetyl group is extremely unstable and only trace cyclization product was
produced. It leaded us to suspect the stability of Boc on such conformationally rigid tricyclic system. So we re-protected the final target 5ec with Boc again and then heated it in the reaction system at same condition without Pd catalyst (Table 5). To our

Scheme 3 Proposed mechanism for the phenanthridinone synthesis
delight, $26 \%$ 5ec was produced and $69 \%$ 6ec remained. This result revealed that Boc was a fragile spot however just heating the substrate couldn't result full decomposition. Pd catalyst should have played a critical role in catalytic cycle for complete cleavage.

Although additional data are needed to establish the mechanism, the fact that Pd catalyst loading influences the reaction significantly and the base KOAc gives the best yield, Boc group is some extend of fragile suggests their critical roles. It leads us to propose a plausible $\operatorname{Pd}(0) / \operatorname{Pd}($ II $)$ catalytic cycle ${ }^{2}$ (Scheme 3). A proton abstraction mechanism previously proposed by Echavarren and Maseras, ${ }^{16}$ was found to explain our reaction outcomes: (1) the anionic ligand KOAc is directly involved in $\mathrm{C}-\mathrm{H}$ bond cleaving; (2) the anion ligand must bind to the catalyst, but not block the catalytic cycle by competitive occupation of vacant coordination sites; ${ }^{17}$ (3) the arene which interacts with the catalyst weakly must compete for binding to the arylpalladium(II) intermediate with the excess anionic ligand. ${ }^{18}$ So initially oxidative addition of polarized $\mathrm{Ph}-\mathrm{Br}$ bond to the $\operatorname{Pd}(0)$ catalyst forms a highly electrophilic arylpalladium intermediate $\mathbf{I},{ }^{18,19}$ which exchange with KOAc to produce intermediate $\mathbf{I I},{ }^{18,20}$ followed by phosphine dissociation. Secondly $\operatorname{Pd}(\mathrm{II})$ interacts with arene at the ortho position of aniline in a C-H activation manner which forms intermediate III. ${ }^{20,21}$ Here HOAc plays a critical role in the stabilized coordination intermediate..$^{21,22}$ Next is irreversible deprotonation: $\mathrm{Pd}($ II $)$ inserts into the $\mathrm{C}-\mathrm{H}$ bond of the arene to give cyclobiarylpalladium intermediate $\mathbf{I V},{ }^{20-22}$ accompanied by elimination of HOAc. Under the effect of produced HOAc, Pd presumably kicks off Boc and coordinates to nitrogen to give intermediate $\mathbf{V}$, which finally undergoes reductive elimination to provide the desired product and regenerates the $\operatorname{Pd}(0)$ catalyst. ${ }^{16,20,22}$

## Conclusions

In summary, we have developed a palladium catalyzed $\mathrm{C}-\mathrm{H}$ arylation method for synthesis of $\mathrm{N}-\mathrm{H}$ phenanthridinones from Boc protected diaryl amide. There are four advantages of using Boc as protection group: (1) the protection stage gives quantitive yield and just simple workup produces pure product; (2) the protection group is stable to some extent compared with acetyl group; (3) the coupling stage directly gives de-protection final targets, additional de-proctection is unnecessary; (3) in contrast to the system of radical pathway without protection reported by Bhakuni et al., the regioisomer is not a concern, only a single desired target was obtained. The catalyst $\operatorname{Pd}\left(t-\mathrm{Bu}_{3} \mathrm{P}\right)_{2}$ is commercial available, inexpensive and the catalyst loading is reasonable; a second phosphine ligand is not required compared to published method. ${ }^{6 d}$ This practical and convenient method can be easily scaled up, applicable for versatile substrates and produces high yields. Most important of all, it could be applied for the less reactive $o$-chlorobenzamides which greatly extend the substrates scope.

## Experimental

## General experimental details

Unless otherwise noted, all materials were obtained from commercial suppliers and used without further purification. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Bruker Avance 400 spectrometer at $25{ }^{\circ} \mathrm{C}$ using DMSO- $d_{6}$ or $\mathrm{CDCl}_{3}$ as the solvent. Chemical shifts ( $\delta$ ) are reported in ppm relative to $\mathrm{Me}_{4} \mathrm{Si}$ (internal standard), coupling constants ( $J$ ) are reported in hertz, and peak multiplicity are reported as $s$ (singlet), d (doublet), t (triplet), q (quartet), m (multiplet), or br s (broad singlet). High resolution mass analysis is performed on a Waters Q-TOF Premier mass spectrometer with electron spray ionization (ESI). Thin layer chromatography (TLC) was performed on 0.20 mm silica gel F-254 plates (Qingdao Haiyang Chemical, China). Visualization of TLC was accomplished with UV light and/or aqueous potassium permanganate or $\mathrm{I}_{2}$ in silica gel. Column chromatography was performed using silica gel 60 of 300-400 mesh (Qingdao Haiyang Chemical, China).

## General procedure for synthesis of $\mathbf{4 x y} \mathbf{x}^{\mathbf{1 0 , 2 3}}$

To suspension of $\mathbf{1 x}(5 \mathrm{mmol})$ in $\mathrm{SOCl}_{2}(5 \mathrm{ml})$ was added with 2 drops of DMF. The mixture was heated under reflux for 3 h . Then the mixture was concentrated and diluted with DCM and concentrated, then diluted and concentrated again to give light brown semi-solid. The residue was dissolved in anhydrous DCM $(10 \mathrm{ml})$, added dropwise to a mixture of $2 \mathbf{y}(5 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(12.5$ $\mathrm{mmol})$ in DCM $(10 \mathrm{ml})$. The resulting suspension was stirred for another 1 h after addition finished. The mixture was diluted with water, washed with $1 \mathrm{~N} \mathrm{HCl}, 2 \mathrm{~N} \mathrm{NaOH}$ and brine successively. The organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated to give the crude amide $3 \mathbf{x y}$ which was used for next step directly.

To the above crude $3 x y$ was added anhydrous DCM ( 20 ml ), DMAP ( 0.05 eq., 0.25 mmol ), and $\mathrm{Boc}_{2} \mathrm{O}$ ( 1.2 eq., 6 mmol ). The suspension was stirred until the bubbling was not observed which indication completion of the reaction. TLC showed a less polar product which was also confirmed by LCMS. The mixture was concentrated, diluted with hexane and water. After stirring for a couple of minutes a precipitate deposited. The solid was filtered, washed with water and hexane, dried under vacuum to give off-white solid $\mathbf{4 x y}$.

General procedure for synthesis of product 5 (Tables 2 and 3)

To a 50 ml two necked flask equipped with a thermometer was added $4 x y(1 \mathrm{mmol})$, DMA ( 10 ml ), KOAc ( 4 eq., 4 mmol$), \operatorname{Pd}(t-$ $\left.\mathrm{Bu}_{3} \mathrm{P}\right)_{2}$ ( $0.05 \mathrm{mmol}, 0.05$ eq.). The mixture was heated under argon at $120-135{ }^{\circ} \mathrm{C}$ for 2 h . It was diluted with $\mathrm{H}_{2} \mathrm{O}(30 \mathrm{ml})$, filtered and the solid was washed with $\mathrm{H}_{2} \mathrm{O}$ and ethanol successively. The crude product was dissolved in DCM/MeOH ( $5: 1$ ), filtered through celite to remove catalyst residue, then concentrated and re-crystallized from hexane/ethyl acetate to give almost pure compound $\mathbf{5 x y}$.

Most of the final compound can be purified by crystallization easily, for those compounds which has good solubility, a short silica gel column purification is necessary.

## Representative gram scale procedure for synthesis of 5

To a three necked 500 ml flask equipped with a thermometer was added $4 \mathbf{l b}(9.13 \mathrm{~g}, 20 \mathrm{mmol}, 1 \mathrm{eq}$.$) , DMA ( 200 \mathrm{ml}$ ), anhydrous KOAc (azeotroped with toluene prior to use) ( 7.85 g , $80 \mathrm{mmol}, 4 \mathrm{eq}.), \operatorname{Pd}\left(t-\mathrm{Bu}_{3} \mathrm{P}\right)_{2}(511.05 \mathrm{mg}, 1 \mathrm{mmol}, 0.05 \mathrm{eq}$.$) . The$ mixture was heated under argon at $120^{\circ} \mathrm{C}$ for 2 h . The mixture was diluted with $\mathrm{H}_{2} \mathrm{O}(30 \mathrm{ml})$ to precipitate the product, filtered and the solid was washed with $\mathrm{H}_{2} \mathrm{O}$ and ethanol successively. The crude product was dissolved in DCM/MeOH (5:1), filtered through celite to remove catalyst residue, then concentrated and re-crystallized from hexane/ethyl acetate to give pure compound $5 \mathbf{5 l b}$ ( $5.23 \mathrm{~g}, 19 \mathrm{mmol}, 95 \%$ yield).

Phenanthridin-6(5H)-one (5aa). Off-white solid, 129 mg , $66 \%$ yield, TLC $R_{\mathrm{f}} 0.5$ (2:1, petroleum ether : EtOAc); ${ }^{1} \mathrm{H}$ NMR (400 MHz, DMSO- $\left.d_{6}\right): \delta 11.69(\mathrm{~s}, 1 \mathrm{H}), 8.52(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 8.40(\mathrm{~d}$, $J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 8.33(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.86(\mathrm{t}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H})$, $7.65(\mathrm{t}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.50(\mathrm{t}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.38(\mathrm{~d}, J=8.0 \mathrm{~Hz}$, $1 \mathrm{H}), 7.27(\mathrm{t}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 100 MHz , DMSO- $d_{6}$ ): $\delta 160.8,136.5,134.2,132.8,129.6,127.9,127.5,125.7,123.2$, $122.6,122.3,117.5,116.1$. ESI-HRMS: calculated for $\mathrm{C}_{13} \mathrm{H}_{9} \mathrm{NNaO}$ $[\mathrm{M}+\mathrm{Na}]^{+} 218.0576$, found 218.0576 .

2-Methoxyphenanthridin-6(5H)-one (5ab). Off-white solid, $198 \mathrm{mg}, 88 \%$ yield, TLC $R_{\mathrm{f}} 0.3$ ( $2: 1$, petroleum ether : EtOAc); ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 11.23(\mathrm{~s}, 1 \mathrm{H}), 8.61(\mathrm{~d}, J=7.6 \mathrm{~Hz}$, $1 \mathrm{H}), 8.26(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.83-7.79(\mathrm{~m}, 1 \mathrm{H}), 7.68-7.62(\mathrm{~m}$, $2 \mathrm{H}), 7.38(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.14-7.11(\mathrm{~m}, 1 \mathrm{H}), 3.93(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 100 MHz, DMSO- $d_{6}$ ): $\delta 160.3,154.8,134.1,132.5,130.7$, 127.9, 127.5, 125.9, 123.0, 118.3, 117.7, 117.3, 106.2, 55.6; HRMS (ESI) $m / z$ calcd for $\mathrm{C}_{14} \mathrm{H}_{11} \mathrm{NNaO}_{2}[\mathrm{M}+\mathrm{Na}]^{+} 248.0682$, found 248.0690 .

3-Isopropylphenanthridin-6(5H)-one (5ae-a). Off-white solid, $123 \mathrm{mg} 52 \%$ yield, TLC $R_{\mathrm{f}} 0.5$ (2:1, petroleum ether : EtOAc); ${ }^{1} \mathrm{H}$ NMR ( 400 MHz, DMSO- $d_{6}$ ): $\delta 11.60(\mathrm{~s}, 1 \mathrm{H}), 8.46(\mathrm{~d}, J=8.0 \mathrm{~Hz}$, $1 \mathrm{H}), 8.31-8.29(\mathrm{~m}, 2 \mathrm{H}), 7.83(\mathrm{t}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.61(\mathrm{t}, J=7.4 \mathrm{~Hz}$, $1 \mathrm{H}), 7.23(\mathrm{~s}, 1 \mathrm{H}), 7.17(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.93-3.00(\mathrm{~m}, 1 \mathrm{H}), 1.25$ $(\mathrm{d}, J=6.8 \mathrm{~Hz}, 6 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 100 MHz, DMSO- $d_{6}$ ): $\delta 160.9$, $150.2,136.6,134.3,132.7,127.4,125.3,123.2,122.4,120.9$, 115.6, 113.4, 33.3, 23.6; HRMS (ESI) $\mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{16} \mathrm{H}_{15} \mathrm{NNaO}$ $[\mathrm{M}+\mathrm{Na}]^{+} 260.1046$, found 260.1033 .

1-Isopropylphenanthridin-6(5H)-one (5ae-b). Brown solid, $87 \mathrm{mg}, 37 \%$ yield, TLC $R_{\mathrm{f}} 0.6$ (20:1, DCM : MeOH); ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 8.93(\mathrm{~s}, 1 \mathrm{H}), 8.42$ $(\mathrm{d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 8.36(\mathrm{~s}, 1 \mathrm{H}), 8.18(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.75-$ $7.68(\mathrm{~m}, 2 \mathrm{H}), 7.36(\mathrm{t}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.57(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR was not obtained due to low solubility; HRMS (ESI) $\mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{15} \mathrm{H}_{10} \mathrm{~N}_{2} \mathrm{NaO}[\mathrm{M}+\mathrm{Na}]^{+}$257.0685, found 257.0696.

8-Methoxy-6-methylthieno[3,2-c]quinolin-4(5H)-one (5kc). Brown solid, $204 \mathrm{mg}, 83 \%$ yield, TLC $R_{\mathrm{f}} 0.7$ (10:1, DCM : MeOH); ${ }^{1} \mathrm{H}$ NMR ( 400 MHz, DMSO- $d_{6}$ ): $\delta 10.73$ ( $\mathrm{s}, 1 \mathrm{H}$ ), $7.78(\mathrm{~d}, J=5.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.60(\mathrm{~d}, J=5.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.11(\mathrm{~d}, J=$ $2.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.01(\mathrm{~d}, J=2.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.83(\mathrm{~s}, 3 \mathrm{H}), 2.46(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 100 MHz, DMSO- $d_{6}$ ): $\delta 158.1,154.1,145.8,131.1,129.0$, 126.7, 126.4, 125.3, 119.3, 116.8, 103.1, 55.4, 17.8; HRMS (ESI) $m / z$ calcd for $\mathrm{C}_{13} \mathrm{H}_{11} \mathrm{NNaO}_{2} \mathrm{~S}[\mathrm{M}+\mathrm{Na}]^{+}$268.0403, found 268.0411.

Dithieno[3,2-b:2' $\mathbf{3}^{\prime}$-d]pyridin-5(4H)-one (5kf). Brown solid, $174 \mathrm{mg}, 84 \%$ yield, TLC $R_{\mathrm{f}} 0.6$ ( $10: 1$, DCM : MeOH); ${ }^{1} \mathrm{H}$ NMR ( 400 MHz, DMSO- $d_{6}$ ): $\delta 12.15$ (s, 1H), 7.79 (d, $J=5.2 \mathrm{~Hz}, 1 \mathrm{H}$ ), $7.62(\mathrm{~d}, J=5.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.54(\mathrm{~d}, J=4.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.09(\mathrm{~d}, J=$ $5.2 \mathrm{~Hz}, 1 \mathrm{H})$; ${ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{DMSO}-d_{6}$ ): $\delta 158.4,142.1$, 139.4, 128.5, 127.6, 125.3, 124.1, 117.6, 112.2; HRMS (ESI) $\mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{9} \mathrm{H}_{6} \mathrm{NOS}_{2}[\mathrm{M}+\mathrm{H}]^{+}$207.9885, found 207.9880.

6-Chlorothieno[3,2-c]quinolin-4(5H)-one (5kg). Brown solid, $167 \mathrm{mg}, 71 \%$ yield, TLC $R_{\mathrm{f}} 0.6$ (20:1, DCM : MeOH); ${ }^{1} \mathrm{H}$ NMR ( 400 MHz, DMSO- $d_{6}$ ): $\delta 10.91(\mathrm{~s}, 1 \mathrm{H}), 7.88-7.86(\mathrm{~m}, 2 \mathrm{H}), 7.66-$ $7.63(\mathrm{~m}, 2 \mathrm{H}), 7.27(\mathrm{t}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 100 MHz , DMSO$\left.d_{6}\right): \delta 157.9,145.3,132.5,131.5,129.4,128.0,125.3,123.1,122.6$, 119.3, 117.9. ESI-HRMS: calculated for $\mathrm{C}_{11} \mathrm{H}_{6} \mathrm{ClNNaOS}[\mathrm{M}+\mathrm{Na}]^{+}$ 257.9751, found 257.9739 .

2-Methoxybenzo $[k]$ phenanthridin-6(5H)-one (5lb). Off-white solid, 250 mg , $91 \%$ yield, TLC $R_{\mathrm{f}} 0.5$ (2:1, petroleum ether: EtOAc); ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , DMSO- $d_{6}$ ): $\delta 11.85(\mathrm{~s}, 1 \mathrm{H}), 9.01(\mathrm{~d}$, $J=7.2 \mathrm{~Hz}, 1 \mathrm{H}), 8.33(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}), 8.17-8.08(\mathrm{~m}, 3 \mathrm{H}), 7.80-$ $7.78(\mathrm{~m}, 2 \mathrm{H}), 7.47(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.28-7.25(\mathrm{~m}, 1 \mathrm{H}), 3.90(\mathrm{~s}$, $3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 100 MHz , DMSO- $d_{6}$ ): $\delta 160.4,154.2,135.7,132.5$, 131.5, 129.0, 128.6, 128.4, 128.1, 127.4, 126.9, 124.9, 122.9, 118.1, 117.4, 117.2, 111.1, 55.5; HRMS (ESI) $\mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{18} \mathrm{H}_{14} \mathrm{NO}_{2}[\mathrm{M}+\mathrm{H}]^{+}$276.1019, found 276.1028.

Benzo[ffthieno[3,2-c]isoquinolin-5(4H)-one (5lf). Brown solid, $229 \mathrm{mg}, 91 \%$ yield, TLC $R_{\mathrm{f}} 0.7$ (20:1, DCM : MeOH); ${ }^{1} \mathrm{H}$ NMR ( 400 MHz, DMSO- $d_{6}$ ): $\delta 12.55(\mathrm{~s}, 1 \mathrm{H}), 8.89(\mathrm{~d}, J=8.4 \mathrm{~Hz}$, $1 \mathrm{H}), 8.39(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}), 8.17(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 8.04-8.01$ $(\mathrm{m}, 2 \mathrm{H}), 7.90(\mathrm{t}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.83(\mathrm{t}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.26(\mathrm{~d}, J$ $=5.6 \mathrm{~Hz}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 100 MHz, DMSO- $d_{6}$ ): $\delta 161.2,140.1$, 135.1, 131.8, 129.4, 129.2, 128.4, 127.6, 127.1, 126.8, 125.5, 124.1, 122.1, 117.4, 112.8; HRMS (ESI) $m / z$ calcd for $\mathrm{C}_{15} \mathrm{H}_{9} \mathrm{NNaO}$ $[\mathrm{M}+\mathrm{Na}]^{+} 274.0297$, found 274.0314 .

4-Chlorobenzo[k]phenanthridin-6(5H)-one (5lg). Grey solid, $210 \mathrm{mg}, 75 \%$ yield, TLC $R_{\mathrm{f}} 0.4$ ( $2: 1$, petroleum ether : EtOAc); ${ }^{1} \mathrm{H}$ NMR ( 400 MHz, DMSO- $d_{6}$ ): $\delta 11.08(\mathrm{~s}, 1 \mathrm{H}), 8.89-8.87(\mathrm{~m}, 1 \mathrm{H})$, $8.58(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 8.33(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 8.20-8.15(\mathrm{~m}$, $2 \mathrm{H}), 7.83-7.74(\mathrm{~m}, 3 \mathrm{H}), 7.38(\mathrm{t}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (100 MHz, DMSO- $d_{6}$ ): $\delta 156.2,131.3,128.2,127.7,124.3,123.9,123.7$, 123.1, 122.2, 122.0, 121.9, 119.6, 118.0, 117.0, 115.1, 114.9, 113.6; HRMS (ESI) $m / z$ calcd for $\mathrm{C}_{17} \mathrm{H}_{11} \mathrm{ClNO}[\mathrm{M}+\mathrm{H}]^{+}$276.1019, found 276.1026 .

2,8-Dimethoxyphenanthridin-6(5H)-one (5mb). Light yellow solid, 174 mg , $68 \%$ yield, TLC $R_{\mathrm{f}} 0.4$ (1:1, petroleum ether: EtOAc); ${ }^{1} \mathrm{H}$ NMR ( 400 MHz, DMSO- $d_{6}$ ): $\delta 11.58(\mathrm{~s}, 1 \mathrm{H}), 8.49$ (d, $J=9.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.80-7.76(\mathrm{~m}, 2 \mathrm{H}), 7.45-7.42(\mathrm{~m}, 1 \mathrm{H}), 7.28(\mathrm{~d}, J=$ $8.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.08(\mathrm{dd}, J=8.8,2.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.92(\mathrm{~s}, 3 \mathrm{H}), 3.86(\mathrm{~s}$, $3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 100 MHz , DMSO- $d_{6}$ ): $\delta 160.1,159.0,154.9,129.6$, 127.5, 127.3, 124.9, 121.3, 118.5, 117.1, 116.5, 108.7, 105.7, 55.6, 55.4; HRMS (ESI) $m / z$ calcd for $\mathrm{C}_{15} \mathrm{H}_{13} \mathrm{NNaO}_{3}[\mathrm{M}+\mathrm{Na}]^{+}$ 278.0788, found 278.0797 .

2,8-Dimethoxy-4-methylphenanthridin-6(5H)-one (5mc). Light yellow solid, $180 \mathrm{mg}, 67 \%$ yield, TLC $R_{\mathrm{f}} 0.5$ (1:1, petroleum ether : EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 8.66(\mathrm{~s}, 1 \mathrm{H})$, $8.08(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.86(\mathrm{~d}, J=2.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.40(\mathrm{~d}, J=$ $2.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.31(\mathrm{dd}, J=8.8,2.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.84(\mathrm{~d}, J=2.0 \mathrm{~Hz}$, $1 \mathrm{H}), 3.90(\mathrm{~s}, 3 \mathrm{H}), 3.83(\mathrm{~s}, 3 \mathrm{H}), 2.40(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 100 MHz , DMSO- $d_{6}$ ): $\delta 160.5,159.0,154.3,128.0,127.8,127.0$, 125.7, 125.2, 121.7, 118.5, 117.9, 108.4, 103.5, 55.5, 17.7; HRMS (ESI) $\mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{16} \mathrm{H}_{15} \mathrm{NNaO}_{3}[\mathrm{M}+\mathrm{Na}]^{+}$292.0944, found 292.0954.

2-Isopropyl-8-methoxyphenanthridin-6(5H)-one ( 5 mk ). Offwhite solid, $120 \mathrm{mg}, 45 \%$ yield, TLC $R_{\mathrm{f}} 0.6$ ( $1: 1$, petroleum ether : EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 11.16(\mathrm{~s}, 1 \mathrm{H}), 8.27$ (d, $J=9.2 \mathrm{~Hz}, 1 \mathrm{H}), 8.03(\mathrm{~d}, J=2.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.99(\mathrm{~s}, 1 \mathrm{H}), 7.42-$
$7.35(\mathrm{~m}, 3 \mathrm{H}), 4.02(\mathrm{~s}, 3 \mathrm{H}), 3.10-3.03(\mathrm{~m}, 1 \mathrm{H}), 1.36(\mathrm{~d}, J=6.8 \mathrm{~Hz}$, $6 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 159.3,143.5,133.1,128.6$, 127.0, 123.8, 122.6, 119.6, 118.5, 116.7, 108.7, 55.7, 34.1, 24.3; HRMS (ESI) $\mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{17} \mathrm{H}_{17} \mathrm{NNaO}_{2}[\mathrm{M}+\mathrm{Na}]^{+}$290.1151, found 290.1147.

3-tert-Butyl-10-methylphenanthridin-6(5H)-one (5nj). Offwhite solid, $207 \mathrm{mg}, 78 \%$ yield, TLC $R_{\mathrm{f}} 0.7$ (1:1, petroleum ether : EtOAc); ${ }^{1} \mathrm{H}$ NMR ( 400 MHz, DMSO- $d_{6}$ ): $\delta 11.58$ (s, 1H), $8.39(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}), 8.29(\mathrm{~d}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.69(\mathrm{~d}, J=$ $7.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.51(\mathrm{t}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.45(\mathrm{~d}, J=1.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.32$ (dd, $J=8.8,2.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.92(\mathrm{~s}, 3 \mathrm{H}), 1.34(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (100 MHz, DMSO- $d_{6}$ ): $\delta 161.0,151.5,136.9,136.8,134.9,133.2,127.1$, $126.8,126.0,119.3,116.4,112.7,34.4,30.8,25.5$; HRMS (ESI) $\mathrm{m} /$ $z$ calcd for $\mathrm{C}_{18} \mathrm{H}_{19} \mathrm{NNaO}[\mathrm{M}+\mathrm{Na}]^{+} 288.1359$, found 288.1370 .

8-Methoxythieno[3,2-c]quinolin-4(5H)-one (5ob). Brown solid, $123 \mathrm{mg}, 53 \%$ yield, TLC $R_{\mathrm{f}} 0.7$ ( $\left.10: 1, \mathrm{DCM}: \mathrm{MeOH}\right) ;{ }^{1} \mathrm{H}$ NMR ( 400 MHz, DMSO- $d_{6}$ ): $\delta 11.63(\mathrm{~s}, 1 \mathrm{H}), 7.79(\mathrm{~d}, J=5.2 \mathrm{~Hz}$, $1 \mathrm{H}), 7.58(\mathrm{~d}, J=5.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.36(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.26(\mathrm{~d}, J=$ $2.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.14(\mathrm{dd}, J=8.8,2.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.85(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{DMSO}-d_{6}$ ): $\delta 157.7,154.6,145.1,131.4,130.4,126.7$, 125.3, 118.2, 117.6, 116.8, 105.2, 55.6; HRMS (ESI) $\mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{12} \mathrm{H}_{9} \mathrm{NNaO}_{2} \mathrm{~S}[\mathrm{M}+\mathrm{Na}]^{+} 254.0246$, found 254.0252 .

8-Isopropylthieno[3,2-c]quinolin-4(5H)-one (5ok). Brown solid, $124 \mathrm{mg}, 51 \%$ yield, TLC $R_{\mathrm{f}} 0.5$ ( $\left.20: 1, \mathrm{DCM}: \mathrm{MeOH}\right) ;{ }^{1} \mathrm{H}$ NMR ( 400 MHz, DMSO- $d_{6}$ ): $\delta 11.67(\mathrm{~s}, 1 \mathrm{H}), 7.77(\mathrm{~d}, J=5.2 \mathrm{~Hz}$, $1 \mathrm{H}), 7.63(\mathrm{~d}, J=2.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.58(\mathrm{~d}, J=5.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.42-7.35$ $(\mathrm{m}, 2 \mathrm{H}), 3.04-2.97(\mathrm{~m}, 1 \mathrm{H}), 1.26(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 6 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 100 MHz, DMSO- $d_{6}$ ): $\delta 158.1,145.6,142.7,134.4,131.1,127.9$, 126.4, 125.3, 120.3, 116.3, 116.1, 32.9, 23.9; HRMS (ESI) m/z calcd for $\mathrm{C}_{14} \mathrm{H}_{13} \mathrm{NNaOS}[\mathrm{M}+\mathrm{Na}]^{+}$266.0610, found 266.0641.

4-Fluoro-7-methoxyphenanthridin-6(5H)-one (5pl). Light yellow solid, 93 mg , $38 \%$ yield, TLC $R_{\mathrm{f}} 0.5$ ( $1: 1$, petroleum ether : EtOAc); ${ }^{1} \mathrm{H}$ NMR ( 400 MHz, DMSO- $d_{6}$ ): $\delta 11.12(\mathrm{~s}, 1 \mathrm{H})$, $8.14(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 8.04(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.78(\mathrm{t}, J=$ $8.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.38-7.34(\mathrm{~m}, 1 \mathrm{H}), 7.24(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.20-7.15$ $(\mathrm{m}, 1 \mathrm{H}), 3.90(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 100 MHz, DMSO- $d_{6}$ ): $\delta 161.0$, 159.0, 150.0, 147.6, 136.4, 133.9, 125.8, 125.7, 121.4, 121.3, 119.5, 114.9, 114.8, 114.7, 111.5, 56.0; HRMS (ESI) $\mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{14} \mathrm{H}_{10} \mathrm{FNNaO}_{2}[\mathrm{M}+\mathrm{Na}]^{+}$266.0588, found 266.0599.

## Conflicts of interest

There are no conflicts of interest to declare.

## Acknowledgements

We thank Chengdu ChemPartner Co., Ltd. for technical, reagents and analysis support. We also thank Lihua Zhou and Professor Lijuan Chen's team of State Key Laboratory of Biotherapy (Sichuan University) for NMR and HRMS measurements.
