# Gold-catalyzed [4+3]- and [4+2]-annulations of 3-en-1-ynamides with isoxazoles $\emph{via}$ novel $6\pi$ -electrocyclizations of 3-azahepta trienyl cations†

Sovan Sundar Giri and Rai-Shung Liu \*

New gold-catalyzed [4+3]-annulations of 3-en-1-ynamides with isoxazoles afford 4H-azepines efficiently; this process involves  $6\pi$  electrocyclizations of gold-stabilized 3-azaheptatrienyl cations. In the presence of Zn(OTf)<sub>2</sub>, the resulting 4H-azepines undergo skeletal rearrangement to furnish substituted pyridine derivatives. We subsequently develop new catalytic [4+2]-annulations between the same 3-en-1-ynamides and isoxazoles to deliver substituted pyridine products using Au(i)/Zn(ii) catalysts. This work reports the first success of the  $6\pi$  electrocyclizations of heptatrienyl cations that are unprecedented in literature reports.

#### Introduction

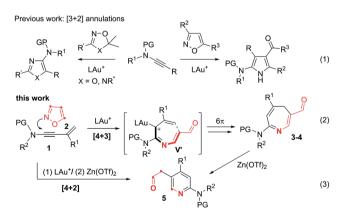

Electrocyclizations of acyclic conjugated  $\pi$ -motifs are powerful tools to access five-, six- and seven-membered carbocycles; prominent examples include Nazarov cyclizations of pentadienyl cations and  $6\pi$  electrocyclizations of trienes, which have found widespread applications in organic synthesis.

**Scheme 1** Electrocyclizations of conjugated  $\pi$ -motifs.

Department of Chemistry, National Tsing-Hua University, Hsinchu, Taiwan, Republic of China. E-mail: rsliu@mx.nthu.edu.tw

In the context of seven-carbon  $\pi$ -motifs, heptatrienyl anions I undergo facile  $8\pi$  electrocyclizations via rapid interconversions among various anion configurations (Scheme 1).<sup>4</sup> In contrast, heptatrienyl cations III<sup>5</sup> exclusively undergo Nazarov reactions because of the difficulties of forming all  $\sigma$ -cis configured cations V that have a high energy state.<sup>5b</sup> 1-Aza- and 1-oxaheptatrienyl cations<sup>6</sup> were also reported to follow Nazarov cyclizations. The realization of a  $6\pi$  electrocyclization of conjugated seven-membered cations is formidable but challenging. This work reveals the first success of such seven-membered cyclizations of gold-stabilized 3-azaheptatrienyl cations V' to form azacyclic products 3-4 via a new C-C bond formation.

The advent of gold catalysis has inspired new annulations between alkynes and poor nucleophiles. N-O containing nucleophiles serve as useful building blocks to construct valuable azacyclic frameworks. Ye and Hashmi reported interesting [3+2]-annulations of isoxazoles or benzisoxazoles with electron-

<sup>†</sup> Electronic supplementary information (ESI) available. CCDC 1589549, 1589562, 1589561, 1589558, 1589559 and 1589560. For ESI and crystallographic data in CIF or other electronic format see DOI: 10.1039/c8sc00232k

rich ynamides, yielding substituted pyrrole derivatives through aza-Nazarov cyclizations of the key intermediate [eqn (1)]. These [3+2]-annulations were extensively expanded to other N–O heterocycles including benzisoxazoles, 1,2,4-oxadiazoles, 1,4,2-dioxazoles and 4,5-dihydro-1,2,4-oxadiazoles, yielding additional five-membered azacycles as depicted in [eqn (1)]. Here, we report two distinct [4+3]- and [4+2]-annulations between 3-en-1-ynamides and isoxazoles using varied catalysts. An Au(ı) catalyst alone delivers 4*H*-azepines 3–4 through 6 $\pi$  electrocyclizations of intermediates V' [eqn (2)] whereas a combined action of Au(ı)/Zn( $\pi$ ) on the same reactants furnishes highly functionalized pyridines 5 [eqn (3)]. With our convenient synthesis, the synthetic utility of new 4*H*-azepines 3–4 is also reported. The synthetic utility of new 4*H*-azepines 3–4 is also reported.

#### Results and discussion

We examined the reactions of 3-methyl-3-en-1-ynamide  ${\bf 1a}$  with 3,5-dimethylisoxazole  ${\bf 2a}$  using various gold catalysts. Heating this mixture  $({\bf 1a}/{\bf 2a}=1:2 \text{ ratio})$  in hot DCE with 5 mol% LAuCl/AgNTf2 [L =  $p(t\text{-Bu})_2(o\text{-biphenyl})$  and IPr] afforded a [4+3]-annulation product, 4H-azepine  ${\bf 3a}$ , in 64% and 75% yields respectively (Table 1, entries 1–2). Under these conditions, a low loading (1.2 equiv.) of 3,5-dimethylisoxazole  ${\bf 2a}$  gave  ${\bf 3a}$  in a decreased yield,  ${\bf ca}$ . 62% (entry 3). With a 10 mol% catalyst, IPrAuCl/AgNTf2 gave a clean reaction, yielding desired  ${\bf 3a}$  up to 91% (entry 4). We tested other phosphine ligands such as PPh3 and P(OPh)3, yielding desired  ${\bf 3a}$  in satisfactory yields (78–81%, entries 5–6). Other counter anions such as OTf $^-$  and SbF $_6^-$  were also effective in producing  ${\bf 3a}$  in 85–88% yields (entries 7–8). AgNTf2 alone was not active at all (entry 9).

Edge Article Chemical Science

Suitable substituents of 3-en-1-ynamides **1** are crucial to achieve  $6\pi$  cyclizations of 3-azaheptatrienyl cations **V**' [eqn (2)]. We tested the reactions on 3-en-1-ynes **1b–1m** bearing a C(3)-substituent to circumvent aza-Nazarov cyclizations as reported in Ye's work. Herein, only entries 9 and 10 showed the presence of 3-azanorcaradienes 3'. We examined these [4+3]-annulations on 3-methyl-3-en-1-ynamides **1b–1e** bearing various sulfonamides NTsR<sup>4</sup> (R<sup>4</sup> = Me, cyclopropyl, benzyl and N(n-C<sub>4</sub>H<sub>9</sub>) (-SO<sub>2</sub>Bu)), affording the desired 4H-azepines **3b–3e** in high yields (84–90%, Table 2, entries 1–4). Nevertheless, this new annulation becomes less efficient for 3-en-1-ynamide **1f** bearing an oxazolidin-2-one to yield product **3f** in 64% yield (entry 5).

We altered the C(3)-substituents as in substrates **1g-1i**; their resulting products **3g-3h** ( $\mathbb{R}^1$  = isopropyl and cyclopropyl) were obtained in 74–79%, and **3i** ( $\mathbb{R}^1$  = Ph) with only 58% yield (entries 6–8). Notably, when a long *n*-butyl group was present as in species **1j** and **1k**, their corresponding reactions afforded compounds **3j/3j'** = 5/1 and **3k/3k'** = 11.1 : 1, respectively, in 55% and 68% yields (entries 9–10). For *E*-configured trisubstituted 3-en-1-yne **1l** ( $\mathbb{R}^1$  = Me,  $\mathbb{R}^2$  = Ph and  $\mathbb{R}^3$  = H), 4*H*-azepine **3l** 

Scheme 2 New functionalization of 4H-azepines.

and pyrrole **6l** were obtained in equal proportions (entry 11). When a cyclohexenyl group was present for alkene as in species **1m**, pyrrole product **6m** was dominant over azepine **3m** (entry 12). Accordingly, preferable 3-en-1-ynes comprise a small R<sup>2</sup> or R<sup>3</sup> substituent whereas R<sup>1</sup> must be substituted. Herein, the structures of 4*H*-azepines **3b** and **3l**, and pyrrole species **6m** were confirmed with X-ray diffraction.<sup>11</sup>

Isoxazoles of a wide scope are compatible with these [4+3]-annulations, as depicted in Table 3. The reaction of unsubstituted isoxazole  $2\mathbf{b}$  with model 3-en-1-ynamide  $1\mathbf{b}$  afforded the desired 4H-azepine  $4\mathbf{a}$  in 84% yield, together with pyrrole  $7\mathbf{a}'$  in only 8% yield (entry 1). Mono-substituted 3-methyl or 5-methyl isoxazoles  $2\mathbf{c}$  and  $2\mathbf{d}$  are also suitable for these annulations to afford compounds  $4\mathbf{b}$  and  $4\mathbf{c}$  in 75% and 87% yields, respectively (entries 2–3). We prepared additional 3,5-disubstituted isoxazoles  $2\mathbf{e}$ – $2\mathbf{i}$  with  $\mathbf{R}^1$  = alkyl and phenyl, and  $\mathbf{R}^2$  = alkyl; their annulations proceed smoothly to produce desired  $4\mathbf{d}$ – $4\mathbf{h}$  in 69–85% yields (entries 4–8). For di-substituted isoxazoles  $2\mathbf{j}$  and  $2\mathbf{k}$  bearing  $\mathbf{R}^2$  = Ph, 4H-azepines  $4\mathbf{i}$  and  $4\mathbf{j}$  were obtained in 61% and 71% yields respectively, together with their rearrangement products  $5\mathbf{i}$  and  $5\mathbf{j}$  in 15–30% yields (entries 9–10). Compounds  $4\mathbf{a}$  and  $5\mathbf{i}$  were characterized by X-ray diffraction.  $^{11}$ 

Our convenient synthesis of 4*H*-azepines provides new synthetic utilities; several new functionalizations are depicted in Scheme 2. NaBH<sub>4</sub>-reduction of species 3**b** delivered an alcohol derivative 7**a** in 84% yield. Selective hydrogenation of the same species afforded 2-aza-1,3-dien-5-one 7**b** in 71% yield. A final treatment of 4*H*-azepine 3**b** with NBS in acetone afforded compound 7**c**, of which the molecular structure was determined by <sup>1</sup>H NOE spectra.

The Lewis-catalyzed rearrangement of 4*H*-azepines 3–4 to substituted pyridines 5 [eqn (3)] is unprecedented in 4*H*-azepine chemistry.<sup>10</sup> We undertook such novel [4+2]-annulations

<sup>&</sup>lt;sup>a</sup> [1] = 0.15 M. <sup>b</sup> Product yields are reported after separation from a silica column. <sup>c</sup> The value in parentheses is reported using a mixture of IPrAuCl/AgNTf<sub>2</sub> (10 mol%) and Zn(OTf)<sub>2</sub> (20 mol%) in hot DCE (70 °C, 48 h); **3b** was also isolated in 28% yield.

Scheme 3 A plausible reaction mechanism.

between 3-en-1-ynamides 1 and isoxazoles 2 using Au(I)/Zn(II) in a relay series, as depicted in Table 4. In the reactions of various 3-substituted 3-en-1-ynamides 1 ( $R^1 = methyl, n$ -butyl, cyclopropyl and isopropyl) with 3,5-dimethylisoxazole 2a, substituted pyridines 5a-5d were obtained in satisfactory yields (51-73%, entries 1-4). In entry 1, if the reaction was performed with combined Au(1)/Zn(11) catalysts in a non-relay operation, compounds 5a and 3b were isolated in 35% and 28% yields respectively. For 3-en-1-ynamide 1a bearing a NMs(n-butyl), the corresponding product 5e was obtained in 63% yield (entry 5). We tested the reactions on 3,5-disubstituted isoxazoles 2e-2f & 2h bearing all alkyl substituents, producing desired 5f-5h in good yields (69-78%, entries 6-8). For such disubstituted isoxazoles bearing  $R^4 = Ph$ , the reactions afforded the desired pyridine derivatives 5i and 5j in 75-80% yields (entries 9-10). The molecular structures of compounds 5a and 5i were characterized by X-ray diffraction.11

Scheme 3 rationalizes the crucial roles of substituents of 3en-1-ynamides in the chemoselectivity that relies on two conformational structures **D** versus **D**'. The N-attack of isoxazole at gold- $\pi$ -ynamide A is expected to form a gold-carbene D', which can be visualized as a gold-stabilized cycloheptatrienyl cation. Conformation **D** is favorable with R = H, which prefers aza-Nazarov reactions. 12 When a C(3)-substituent is present (R = alkyl and aryl), all  $\sigma$ -cis configured species  $\mathbf{D}'$  are the preferable geometry to induce novel  $6\pi$  electrocyclizations. This ring closure is expected to proceed through an attack of enamide at the alkenylgold moiety that is also visualized as a goldstabilized cation. Additional C(4)-substituents render the formation of cations D' difficult, thus yielding pyrrole 6 as byproducts. A loss of an acidic proton from seven-membered cations E is expected to yield azepines 3-4. 4H-Azepines 3-4 bear an enone conjugated with a triene; this extensive conjugation is very stable to impede a  $6\pi$  electrocyclization of their triene moieties unless a Lewis acid is present. Zn(OTf)<sub>2</sub> likely coordinates with the carbonyl of 4H-azepine 3 to generate a 2azapentadienyl cation F bearing a zinc enolate, further enabling an intramolecular cyclization to generate species G. A 1,2-acyl shift14 of species G delivers the observed product 5.13

#### Conclusions

In summary, this work describes new gold-catalyzed [4+3] annulations of 3-substituted 3-en-1-ynamides with isoxazoles to form 4*H*-azepines. A relay catalysis is also developed with Au(1)/Zn(11) catalysts to achieve [4+2] annulations from the same reactants. The mechanisms of gold-catalyzed [4+3] annulations involve unprecedented  $6\pi$  electrocyclizations of 3-azacycloheptatrienyl cations to form 4*H*-azepines 3–4 efficiently. Control experiments confirm that 4*H*-azepines 3–4 are catalyzed by Zn(OTf)<sub>2</sub> to undergo new rearrangement reactions to form substituted pyridine derivatives.

- 13 As suggested by one reviewer, an alternative mechanism is also possible for the  $Zn(\pi)$ -catalyzed rearrangement; this process involves an isomerization of initial species 3 to an unconjugated iminoyl ketone H, followed by a  $6\pi$ -cyclization to generate species I. A subsequent  $Zn(\pi)$ -catalyzed aromatization of species I is expected to yield the final product 5. In this process, species I is relatively higher than 3 in energy, but its feasibility is not excluded.

$$0 \longrightarrow \frac{1}{3} \xrightarrow{\sum nX_2} 0 \longrightarrow \frac{R}{N} \xrightarrow{T_S} \frac{1}{X_2Z_n} 0 \longrightarrow \frac{$$
