# Gold-catalyzed [4+3]- and [4+2]-annulations of 3 -en-1-ynamides with isoxazoles via novel $6 \pi$ electrocyclizations of 3-azahepta trienyl cations $\dagger$ 

Sovan Sundar Giri and Rai-Shung Liu (D) *

#### Abstract

New gold-catalyzed [4+3]-annulations of 3-en-1-ynamides with isoxazoles afford 4 H -azepines efficiently; this process involves $6 \pi$ electrocyclizations of gold-stabilized 3-azaheptatrienyl cations. In the presence of $\mathrm{Zn}(\mathrm{OTf})_{2}$, the resulting 4 H -azepines undergo skeletal rearrangement to furnish substituted pyridine derivatives. We subsequently develop new catalytic [4+2]-annulations between the same 3-en-1ynamides and isoxazoles to deliver substituted pyridine products using Au(I)/Zn(॥) catalysts. This work reports the first success of the $6 \pi$ electrocyclizations of heptatrienyl cations that are unprecedented in literature reports.

## Introduction

Electrocyclizations of acyclic conjugated $\pi$-motifs are powerful tools to access five-, six- and seven-membered carbocycles; ${ }^{1}$ prominent examples include Nazarov cyclizations of pentadienyl cations ${ }^{2}$ and $6 \pi$ electrocyclizations of trienes, ${ }^{3}$ which have found widespread applications in organic synthesis.

Scheme 1 Electrocyclizations of conjugated $\pi$-motifs.

[^0]In the context of seven-carbon $\pi$-motifs, heptatrienyl anions I undergo facile $8 \pi$ electrocyclizations via rapid interconversions among various anion configurations (Scheme 1). ${ }^{4}$ In contrast, heptatrienyl cations III $^{5}$ exclusively undergo Nazarov reactions because of the difficulties of forming all $\sigma$-cis configured cations $\mathbf{V}$ that have a high energy state. ${ }^{5 b}$ 1-Aza- and 1oxaheptatrienyl cations ${ }^{6}$ were also reported to follow Nazarov cyclizations. The realization of a $6 \pi$ electrocyclization of conjugated seven-membered cations is formidable but challenging. This work reveals the first success of such sevenmembered cyclizations of gold-stabilized 3-azaheptatrienyl cations $\mathbf{V}^{\prime}$ to form azacyclic products 3-4 via a new C-C bond formation.

The advent of gold catalysis has inspired new annulations between alkynes and poor nucleophiles. ${ }^{7} \mathrm{~N}-\mathrm{O}$ containing nucleophiles serve as useful building blocks to construct valuable azacyclic frameworks. ${ }^{7}$ Ye and Hashmi reported interesting [3+2]-annulations of isoxazoles or benzisoxazoles with electron-
rich ynamides, yielding substituted pyrrole derivatives through aza-Nazarov cyclizations of the key intermediate [eqn (1)]..$^{7,8}$ These [3+2]-annulations were extensively expanded to other $\mathrm{N}-\mathrm{O}$ heterocycles including benzisoxazoles, 1,2,4-oxadiazoles, 1,4,2-dioxazoles and 4,5-dihydro-1,2,4-oxadiazoles, yielding additional five-membered azacycles as depicted in [eqn (1)]. ${ }^{9}$ Here, we report two distinct [4+3]- and [4+2]-annulations between 3-en-1-ynamides and isoxazoles using varied catalysts. An $\mathrm{Au}(\mathrm{I})$ catalyst alone delivers 4 H -azepines 3-4 through $6 \pi$ electrocyclizations of intermediates $\mathbf{V}^{\prime}$ [eqn (2)] whereas a combined action of $\mathrm{Au}(\mathrm{I}) / \mathrm{Zn}(\mathrm{II})$ on the same reactants furnishes highly functionalized pyridines 5 [eqn (3)]. With our convenient synthesis, the synthetic utility of new 4 H -azepines 3 4 is also reported. ${ }^{10}$

## Results and discussion

We examined the reactions of 3-methyl-3-en-1-ynamide 1a with 3,5-dimethylisoxazole 2a using various gold catalysts. Heating this mixture ( $\mathbf{1 a} / \mathbf{2 a}=1: 2$ ratio) in hot DCE with $5 \mathrm{~mol} \% \mathrm{LAuCl} /$ $\mathrm{AgNTf}_{2}\left[\mathrm{~L}=p(t-\mathrm{Bu})_{2}(o\right.$-biphenyl) and IPr] afforded a [4+3]annulation product, 4 H -azepine 3 a , in $64 \%$ and $75 \%$ yields respectively (Table 1, entries 1-2). Under these conditions, a low loading ( 1.2 equiv.) of 3,5-dimethylisoxazole 2a gave 3a in a decreased yield, ca. $62 \%$ (entry 3). With a $10 \mathrm{~mol} \%$ catalyst, IPrAuCl/ $\mathrm{AgNTf}_{2}$ gave a clean reaction, yielding desired 3 a up to $91 \%$ (entry 4). We tested other phosphine ligands such as $\mathrm{PPh}_{3}$ and $\mathrm{P}(\mathrm{OPh})_{3}$, yielding desired 3a in satisfactory yields ( $78-81 \%$, entries 5-6). Other counter anions such as OTf ${ }^{-}$and $\mathrm{SbF}_{6}{ }^{-}$were also effective in producing 3a in $85-88 \%$ yields (entries $7-8$ ). $\mathrm{AgNTf}_{2}$ alone was not active at all (entry 9).

| Entry | $\left(\mathrm{R}^{1}, \mathrm{R}^{2}\right)$ | $\mathbf{2}$ | Time $[\mathrm{h}]$ |

[^1]Suitable substituents of 3-en-1-ynamides $\mathbf{1}$ are crucial to achieve $6 \pi$ cyclizations of 3-azaheptatrienyl cations $\mathbf{V}^{\prime}$ [eqn (2)]. We tested the reactions on 3 -en-1-ynes 1b-1m bearing a C(3)substituent to circumvent aza-Nazarov cyclizations as reported in Ye's work. ${ }^{7}$ Herein, only entries 9 and 10 showed the presence of 3 -azanorcaradienes $3^{\prime}$. We examined these [4+3]-annulations on 3-methyl-3-en-1-ynamides $\mathbf{1 b} \mathbf{- 1 \mathbf { e }}$ bearing various sulfonamides $\mathrm{NTsR}^{4}\left(\mathrm{R}^{4}=\mathrm{Me}\right.$, cyclopropyl, benzyl and $\mathrm{N}\left(n-\mathrm{C}_{4} \mathrm{H}_{9}\right)$ $\left(-\mathrm{SO}_{2} \mathrm{Bu}\right)$ ), affording the desired $4 H$-azepines $3 \mathbf{b}-3 \mathbf{e}$ in high yields (84-90\%, Table 2, entries 1-4). Nevertheless, this new annulation becomes less efficient for 3-en-1-ynamide $\mathbf{1 f}$ bearing an oxazolidin-2-one to yield product $3 f$ in $64 \%$ yield (entry 5).

We altered the C(3)-substituents as in substrates $\mathbf{1 g - 1 i}$; their resulting products $\mathbf{3 g}-\mathbf{3 h}\left(\mathrm{R}^{1}=\right.$ isopropyl and cyclopropyl) were obtained in $74-79 \%$, and $3 \mathbf{i}\left(\mathrm{R}^{1}=\mathrm{Ph}\right)$ with only $58 \%$ yield (entries 6-8). Notably, when a long $n$-butyl group was present as in species $\mathbf{1 j}$ and $\mathbf{1 k}$, their corresponding reactions afforded compounds $3 \mathbf{j} / 3 \mathbf{j}^{\prime}=5 / 1$ and $3 \mathbf{k} / 3 \mathbf{k}^{\prime}=11.1: 1$, respectively, in $55 \%$ and $68 \%$ yields (entries $9-10$ ). For $E$-configured trisubstituted 3-en-1-yne $\mathbf{1 1}\left(\mathrm{R}^{1}=\mathrm{Me}, \mathrm{R}^{2}=\mathrm{Ph}\right.$ and $\left.\mathrm{R}^{3}=\mathrm{H}\right), 4 H$-azepine 31

Scheme 2 New functionalization of 4 H -azepines.
and pyrrole 61 were obtained in equal proportions (entry 11). When a cyclohexenyl group was present for alkene as in species $\mathbf{1 m}$, pyrrole product $\mathbf{6 m}$ was dominant over azepine $\mathbf{3 m}$ (entry 12). Accordingly, preferable 3-en-1-ynes comprise a small $R^{2}$ or $R^{3}$ substituent whereas $R^{1}$ must be substituted. Herein, the structures of $4 H$-azepines $\mathbf{3 b}$ and $\mathbf{3 1}$, and pyrrole species $\mathbf{6 m}$ were confirmed with X-ray diffraction. ${ }^{11}$

Isoxazoles of a wide scope are compatible with these [4+3]annulations, as depicted in Table 3. The reaction of unsubstituted isoxazole $\mathbf{2 b}$ with model 3-en-1-ynamide $\mathbf{1 b}$ afforded the desired $4 H$-azepine $\mathbf{4 a}$ in $84 \%$ yield, together with pyrrole $7 \mathbf{a}^{\prime}$ in only $8 \%$ yield (entry 1 ). Mono-substituted 3-methyl or 5-methyl isoxazoles $2 \mathbf{c}$ and $2 \mathbf{d}$ are also suitable for these annulations to afford compounds $\mathbf{4 b}$ and $\mathbf{4 c}$ in $75 \%$ and $87 \%$ yields, respectively (entries $2-3$ ). We prepared additional 3,5 -disubstituted isoxazoles $2 \mathbf{e}-2 \mathbf{i}$ with $\mathrm{R}^{1}=$ alkyl and phenyl, and $\mathrm{R}^{2}=$ alkyl; their annulations proceed smoothly to produce desired $4 d-4 h$ in 69$85 \%$ yields (entries 4-8). For di-substituted isoxazoles $2 \mathbf{j}$ and $\mathbf{2 k}$ bearing $\mathrm{R}^{2}=\mathrm{Ph}, 4 H$-azepines $\mathbf{4 i}$ and $\mathbf{4 j}$ were obtained in $61 \%$ and $71 \%$ yields respectively, together with their rearrangement products $5 \mathbf{i}$ and $5 \mathbf{j}$ in 15-30\% yields (entries 9-10). Compounds 4 a and $5 \mathbf{i}$ were characterized by X-ray diffraction. ${ }^{11}$

Our convenient synthesis of $4 H$-azepines provides new synthetic utilities; several new functionalizations are depicted in Scheme 2. $\mathrm{NaBH}_{4}$-reduction of species 3b delivered an alcohol derivative 7 a in $84 \%$ yield. Selective hydrogenation of the same species afforded 2-aza-1,3-dien-5-one $\mathbf{7 b}$ in $71 \%$ yield. A final treatment of 4 H -azepine $\mathbf{3 b}$ with NBS in acetone afforded compound $7 \mathbf{c}$, of which the molecular structure was determined by ${ }^{1} \mathrm{H}$ NOE spectra.

The Lewis-catalyzed rearrangement of $4 H$-azepines 3-4 to substituted pyridines 5 [eqn (3)] is unprecedented in $4 H$-azepine chemistry. ${ }^{10}$ We undertook such novel [4+2]-annulations

${ }^{a}[\mathbf{1}]=0.15 \mathrm{M} .{ }^{b}$ Product yields are reported after separation from a silica column. ${ }^{c}$ The value in parentheses is reported using a mixture of IPrAuCl/ $\operatorname{AgNTf}_{2}(10 \mathrm{~mol} \%)$ and $\mathrm{Zn}(\mathrm{OTf})_{2}(20 \mathrm{~mol} \%)$ in hot $\mathrm{DCE}\left(70^{\circ} \mathrm{C}, 48 \mathrm{~h}\right) ; 3 \mathrm{~b}$ was also isolated in $28 \%$ yield.

Scheme 3 A plausible reaction mechanism
between 3-en-1-ynamides 1 and isoxazoles 2 using $\mathrm{Au}(\mathrm{I}) / \mathrm{Zn}(\mathrm{II})$ in a relay series, as depicted in Table 4. In the reactions of various 3 -substituted 3 -en-1-ynamides $\mathbf{1}\left(\mathrm{R}^{1}=\right.$ methyl, $n$-butyl, cyclopropyl and isopropyl) with 3,5-dimethylisoxazole 2a, substituted pyridines $5 \mathbf{5}-5 \mathrm{~d}$ were obtained in satisfactory yields (51-73\%, entries $1-4$ ). In entry 1 , if the reaction was performed with combined $\mathrm{Au}(\mathrm{I}) / \mathrm{Zn}(\mathrm{II})$ catalysts in a non-relay operation, compounds $5 \mathbf{a}$ and $\mathbf{3 b}$ were isolated in $35 \%$ and $28 \%$ yields respectively. For 3-en-1-ynamide 1a bearing a $\mathrm{NMs}(n$-butyl), the corresponding product 5 e was obtained in $63 \%$ yield (entry 5 ). We tested the reactions on 3,5-disubstituted isoxazoles $2 \mathbf{e}-2 \mathbf{f} \&$ 2h bearing all alkyl substituents, producing desired $\mathbf{5 f}-\mathbf{5 h}$ in good yields (69-78\%, entries 6-8). For such disubstituted isoxazoles bearing $\mathrm{R}^{4}=\mathrm{Ph}$, the reactions afforded the desired pyridine derivatives $5 \mathbf{i}$ and $\mathbf{5 j}$ in $75-80 \%$ yields (entries $9-10$ ). The molecular structures of compounds $\mathbf{5 a}$ and $5 \mathbf{i}$ were characterized by X-ray diffraction. ${ }^{11}$

Scheme 3 rationalizes the crucial roles of substituents of 3-en-1-ynamides in the chemoselectivity that relies on two conformational structures $\mathbf{D}$ versus $\mathbf{D}^{\prime}$. The N -attack of isoxazole at gold- $\pi$-ynamide $\mathbf{A}$ is expected to form a gold-carbene $\mathbf{D}^{\prime}$, which can be visualized as a gold-stabilized cycloheptatrienyl cation. Conformation $D$ is favorable with $R=H$, which prefers aza-Nazarov reactions. ${ }^{12}$ When a C(3)-substituent is present ( $\mathrm{R}=$ alkyl and aryl), all $\sigma$-cis configured species $\mathbf{D}^{\prime}$ are the preferable geometry to induce novel $6 \pi$ electrocyclizations. This ring closure is expected to proceed through an attack of enamide at the alkenylgold moiety that is also visualized as a goldstabilized cation. Additional $\mathrm{C}(4)$-substituents render the formation of cations $\mathbf{D}^{\prime}$ difficult, thus yielding pyrrole 6 as byproducts. A loss of an acidic proton from seven-membered cations $\mathbf{E}$ is expected to yield azepines 3-4. 4H-Azepines 3-4 bear an enone conjugated with a triene; this extensive conjugation is very stable to impede a $6 \pi$ electrocyclization of their triene moieties unless a Lewis acid is present. $\mathrm{Zn}(\mathrm{OTf})_{2}$ likely coordinates with the carbonyl of 4 H -azepine 3 to generate a 2 azapentadienyl cation $\mathbf{F}$ bearing a zinc enolate, further enabling an intramolecular cyclization to generate species G. A 1,2-acyl shift ${ }^{14}$ of species $\mathbf{G}$ delivers the observed product $5 .{ }^{13}$

## Conclusions

In summary, this work describes new gold-catalyzed [4+3] annulations ${ }^{15}$ of 3 -substituted 3-en-1-ynamides with isoxazoles to form $4 H$-azepines. A relay catalysis is also developed with $\mathrm{Au}(\mathrm{I}) / \mathrm{Zn}(\mathrm{II})$ catalysts to achieve [4+2] annulations from the same reactants. The mechanisms of gold-catalyzed [4+3] annulations involve unprecedented $6 \pi$ electrocyclizations of 3 -azacycloheptatrienyl cations to form 4 H -azepines 3-4 efficiently. Control experiments confirm that 4 H -azepines $\mathbf{3 - 4}$ are catalyzed by $\mathrm{Zn}(\mathrm{OTf})_{2}$ to undergo new rearrangement reactions to form substituted pyridine derivatives.

Lett., 2012, 14, 5736; (c) R. L. Sahani and R. S. Liu, Angew. Chem., Int. Ed., 2017, 56, 12736; (d) S. K. Pawar, R. L. Sahani and R. S. Liu, Chem.Eur. J., 2015, 21, 10843; (e) C. Shu, Y. H. Wang, C. H. Shen, P. P. Ruan, X. Lu and L. W. Ye, Org. Lett., 2016, 18, 3254.

13 As suggested by one reviewer, an alternative mechanism is also possible for the $\mathrm{Zn}(\mathrm{II})$-catalyzed rearrangement; this process involves an isomerization of initial species 3 to an unconjugated iminoyl ketone $\mathbf{H}$, followed by a $6 \pi$ cyclization to generate species $\mathbf{I}$. A subsequent $\mathrm{Zn}(\mathrm{II})$ catalyzed aromatization of species I is expected to yield the final product 5. In this process, species $\mathbf{H}$ is relatively higher than 3 in energy, but its feasibility is not excluded.
