One-pot synthesis of chromenes in the presence of nano-cellulose/Ti^(IV)/Fe₃O₄ as natural-based magnetic nano-catalysts under solvent free conditions†

Raziyeh Gholami,^a Abdolhamid Bamoniri ^{*a} and Bi Bi Fatemeh Mirjalili ^b

In this study, the preparation of magnetic catalysts of titanium tetrachloride stabilized on nano-cellulose named cellulose/Ti^(IV)/Fe₃O₄ was investigated. Various methods such as XRD, SEM, FT-IR, BET, EDX, TEM, TGA and VSM were used to characterize the catalysts. Then, the identified catalysts were used for the synthesis of various chromene skeletons via reaction of malononitrile, aldehyde and dimedone, 4-hydroxycoumarine or 2-naphthole at 70 °C under solvent free conditions. The spectroscopic methods used to determine the structure of the products include ¹³C NMR, ¹H NMR and FT-IR.

Introduction

Multi-component reactions (MCRs) are important and useful tools for producing complex molecules from simple raw materials. In these reactions, three or more simple raw materials participate in a condensation reaction to form more complex organic molecules through the formation of carbon–carbon or carbon–heteroatom bonds. MCRs are performed simultaneously and in a one-pot reaction, and without the separation of intermediates the reaction efficiency increases significantly. This type of reaction saves time, energy and raw materials. They also have other advantages such as making new multiple bonds, high efficiency, saving on solvents and chemicals, reducing by-product production, simple product separation and modest purification. MCRs are a useful method for the synthesis of a variety of molecules that take place without the separation of intermediates.

Catalysts have become a strategic part of modern science. Nano-dimensions have provided ideal conditions for catalyst science. Active levels and excellent selectivity in nano-catalysts have led to increased reaction speed and efficiency. Among magnetic nano-particles, Fe₃O₄ nano-particles have a higher capacity for better recycling and are used as a support in the synthesis of organic compounds. In recent years, the focus has been on magnetic nano-catalysts for the synthesis of heterocyclic compounds and subsequent drug production.

Heterocyclic compounds play an important role in drug synthesis. Among them, the chromenes are very significant. Chromenes are an important class of oxygenated heterocyclic compounds that have gained considerable importance due to their reactivity, diverse biological activity, and therapeutic applications.^{1,2} Among the biological properties of chromenes,³ we can mention the antimicrobial^{4,5} and inhibitory properties of influenza virus, antitumor, effect on the nervous system in the treatment of Alzheimer's, hypertension and seizures and anti-HIV properties. Due to the research done and the widespread use of chromene derivatives as pharmaceutical and biologically active compounds and the development of green chemistry to provide an easy, effective and rapid way to prepare this family of compounds is very important. However, various methods have been reported for the preparation of these compounds. But due to problems such as solvent use, long reaction time, toxicity and non-recovery, they have been replaced by new methods. The use of magnetic catalysts in nano-dimensions, in comparison with other catalysts presented for the preparation of these compounds are very suitable and has been considered by many researchers today.^{6,7} Increasing the efficiency and reducing the reaction time by using environmentally friendly catalysts, and also preparing high-purity organic compounds were the main reasons for this research. Herein, we report a simple and efficient method for the synthesis and preparation of various chromenes using various aldehydes by natural based nano-cellulose/Ti^(IV)/Fe₃O₄ catalyst.

Experimental

Materials and apparatus

All chemicals were obtained from Merck and Fluka companies and used without any additional purification. FT-IR spectra were

† Electronic supplementary information (ESI) available. See <https://doi.org/10.1039/d2ra05057a>

obtained on a Magna 550 Nicolet spectrometers. A Bruker (DRX-400 Avance) NMR was used to record the ^1H NMR spectra. Melting points were determined by a Buchi melting point B-540 B.V.CHI apparatus. XRD pattern was achieved on Philips Xpert MP diffract meter (Cu K α , radiation, $k = 0.154056$ nm). FESEM was obtained on a Mira Tescan, Phenom pro X. BET surface area analysis was done with micrometrics, Tristar II 3020 analyzer. TGA was done with STA 504 instrument. Sonication was performed in Kunshan KQ-250B ultrasonic reactor with a frequency of 40 kHz and a nominal power of 250 W. The products were characterized by FT-IR, ^1H NMR, and a comparison of their physical properties with those reported in the literature.

Preparation of nano-cellulose/Ti^(IV)/Fe₃O₄ nano-particles

Firstly, for preparation of nano-cellulose/Ti^(IV), an amount of 0.5 mL of TiCl₄ was added dropwise to a mixture of nano-cellulose (0.5 g) in 5 mL of dichloromethane and stirred for 1 h at room temperature. Then, the resulting mixture was filtered and washed with dichloromethane and dried at room temperature. Subsequently, the resulting nano-cellulose/Ti^(IV) with 0.5 g of Fe₃O₄ nano-particles was dispersed in 5 mL of dichloromethane under ultrasound irradiation at room temperature for 1 h. Then, the resulting suspension was filtered and washed with dichloromethane and dried at room temperature so that nano-cellulose/Ti^(IV)/Fe₃O₄ catalyst was obtained.

General procedure for the synthesis of chromens in the presence of nano-cellulose/Ti^(IV)/Fe₃O₄ as nano-catalyst under solvent-free conditions.

In a 100 mL flask, a mixture of aromatic aldehyde (1 mmol), malononitrile (1.5 mmol) and 1,3-diketone (1 mmol) in the presence of 0.012 g of nano-cellulose/Ti^(IV)/Fe₃O₄ was added. The mixture was stirred for the required time at 70 °C. During the reaction, its progression was followed by thin layer chromatography (TLC, ethyl acetate : hexane, 3 : 7). At the end of the reaction, the mixture was cooled to room temperature and then the catalyst was separated from the reaction solution by an external magnet. For further purification, the product was recrystallized from ethanol, and at the end the product was washed three times with 10 mL of cold diethyl ether. The isolated catalyst was also rinsed several times with chloroform and hot ethanol for reuse.

2-Amino-7,7-dimethyl-5-oxo-4-phenyl-5,6,7,8-tetrahydro-4H-chromene-3-carbonitrile (4a). Milky solid; mp = 238–240 °C; IR (KBr) $\bar{\nu}$ (cm⁻¹): 3395, 3324 (NH₂), 3083, 3028 (C_{Ar-H}), 2198 (C \equiv N), 1661 (C=O), 1602 (C=C), 1035 (C-O); ^1H -NMR (DMSO-d₆, 400 MHz) δ (ppm): 0.94 (s, 3H, CH₃), 1.02 (s, 3H, CH₃), 2.08 (m, 2H, CH₂), 2.24 (m, 2H, CH₂), 4.15 (s, 1H, CH), 6.97 (s, 2H, NH₂), 7.14 (t, $J = 7.12$ Hz, 3H, Ar-H), 7.25–7.28 (m, 2H, Ar-H).

2-Amino-4-(4-hydroxy-3-methoxyphenyl)-7,7-dimethyl-5-oxo-5,6,7,8-tetrahydro-4H-chromene-3-carbonitrile (4b). White solid; mp = 230–231 °C; IR (KBr) $\bar{\nu}$ (cm⁻¹): 3497 (O-H), 3403, 3324 (NH₂), 3016 (Ar-H), 2192 (C \equiv N), 1654 (C=O), 1603 (C=C), 1034 (C-O); ^1H -NMR (DMSO-d₆, 400 MHz) δ (ppm): 0.95 (s, 3H, CH₃), 1.02 (s, 3H, CH₃), 2.08 (m, 2H, CH₂), 2.23 (m, 2H, CH₂), 3.69 (s, 3H, OCH₃), 4.05 (s, 1H, CH), 6.48–6.51 (m, 1H), 6.62–6.66 (m, 2H), 6.89 (s, 2H, NH₂), 8.80 (s, 1H, OH).

2-Amino-4-(4-chlorophenyl)-7,7-dimethyl-5-oxo-5,6,7,8-tetrahydro-4H-chromene-3-carbonitrile (4c). White crystal; mp = 210–212 °C; IR (KBr) $\bar{\nu}$ (cm⁻¹): 3380, 3323 (NH₂), 3183, 2959 (Ar-H), 2188 (C \equiv N), 1676 (C=O), 1603 (C=C), 1032 (C-O); ^1H -NMR (DMSO-d₆, 400 MHz) δ (ppm): 0.92 (s, 3H, CH₃), 1.01 (s, 3H, CH₃), 2.08 (m, 2H, CH₂), 2.22 (m, 2H, CH₂), 4.17 (s, 1H, CH), 7.03 (s, 2H, NH₂), 7.15 (d, $J = 8.44$ Hz, 2H), 7.32 (d, $J = 8.4$ Hz, 1H).

2-Amino-4-(2,4-dimethoxyphenyl)-7,7-dimethyl-5-oxo-5,6,7,8-tetrahydro-4H-chromene-3-carbonitrile (4d). Yellowish white; mp = 229–231 °C; IR (KBr) $\bar{\nu}$ (cm⁻¹): 3390, 3326 (NH₂), 3256, 3213, 2954 (Ar-H), 2193 (C \equiv N), 1657 (C=O), 1604 (C=C), 1031 (C-O); ^1H -NMR (DMSO-d₆, 400 MHz) δ (ppm): 0.96 (3H, s, CH₃), 1.01 (3H, s, CH₃), 2.07 (m, 2H, CH₂), 2.21 (m, 2H, CH₂), 3.68 (6H, s, OCH₃), 4.09 (1H, s, CH), 6.83 (4H, br s, H-Ar, NH₂).

2-Amino-7,7-dimethyl-4-(2-nitrophenyl)-5-oxo-5,6,7,8-tetrahydro-4H-chromene-3-carbonitrile (4e). Milky solid; mp = 236–238 °C; IR (KBr) $\bar{\nu}$ (cm⁻¹): 3471, 3332 (NH₂), 3255, 3210, 2960 (Ar-H), 2194 (C \equiv N), 1688 (C=O), 1602 (C=C), 1525, 1596 (NO₂), 1041 (C-O); ^1H -NMR (DMSO-d₆, 400 MHz) δ (ppm): 0.81 (s, 3H, CH₃), 0.94 (s, 3H, CH₃), 1.94 (m, 2H, CH₂), 2.13 (m, 2H, CH₂), 4.86 (s, 1H), 7.11 (s, 2H, NH₂), 7.28 (dd, $J = 6.78, 1.00$ Hz, 1H), 7.36 (t, $J = 7.2$ Hz, 1H), 7.57–7.75 (m, 2H).

2-Amino-4-(2-methoxyphenyl)-7,7-dimethyl-5-oxo-5,6,7,8-tetrahydro-4H-chromene-3-carbonitrile (4f). Light brown solid; mp = 195–197 °C; IR (KBr) $\bar{\nu}$ (cm⁻¹): 3396, 3329 (NH₂), 3262, 3219, 2964 (Ar-H), 2189 (C \equiv N), 1685 (C=O), 1654 (C=C), 1036 (C-O); ^1H -NMR (DMSO-d₆, 400 MHz) δ (ppm): 0.95 (3H, s, CH₃), 1.02 (3H, s, CH₃), 2.14 (m, 2H, CH₂), 3.73 (3H, s, OCH₃), 4.45 (1H, s, CH), 6.82 (2H, br s, NH₂), 6.96 (2H, br s, H-Ar), 7.14 (1H, br s, H-Ar).

4,4'-(1,4-Phenylene)bis(2-amino-7,7-dimethyl-5-oxo-5,6,7,8-tetrahydro-4H-chromene-3-carbonitrile) (4g). White solid; mp = >280 °C; IR (KBr) $\bar{\nu}$ (cm⁻¹): 3392, 3325 (NH₂), 3254, 3211, 2963 (Ar-H), 2194 (C \equiv N), 1686 (C=O), 1649 (C=C), 1041 (C-O); ^1H -NMR (DMSO-d₆, 400 MHz) δ (ppm): 0.93 (3H, s, CH₃), 1.02 (3H, s, CH₃), 2.15 (m, 2H, CH₂), 4.24 (1H, s, CH), 7.08 (2H, br s, NH₂), 7.25 (2H, d, $J = 8$, H-Ar), 7.85 (2H, d, $J = 8$, H-Ar).

2-Amino-5-oxo-4-(*m*-tolyl)-4,5-dihydropyrano[3,2-*c*]chromene-3-carbonitrile (4h). White solid; mp = 253–255 °C; IR (KBr) $\bar{\nu}$ (cm⁻¹): 3390, 3321 (NH₂), 3050, 3015 (Ar-H), 2198 (C \equiv N), 1705, 1674 (C=O), 1603 (C=C), 1060 (C-O); ^1H -NMR (DMSO-d₆, 400 MHz) δ (ppm): 2.24 (3H, s, CH₃), 4.42 (1H, s, CH), 7.03 (3H, br s, NH₂), 7.183 (1H, t, $J = 8$, H-Ar), 7.379 (1H, s, H-Ar), 7.445 (1H, d, $J = 11$, H-Ar), 7.49 (1H, d, $J = 9.5$, H-Ar), 7.69 (1H, t, $J = 9.5$, H-Ar), 7.89 (1H, d, $J = 9.5$, H-Ar).

2-Amino-5-oxo-4-(2-chlorophenyl)-4,5-dihydropyrano[3,2-*c*]chromene-3-carbonitrile (4i). Milky solid; mp = 265–267 °C; IR (KBr) $\bar{\nu}$ (cm⁻¹): 3398, 3284 (NH₂), 3179 (Ar-H), 2199 (C \equiv N), 1708, 1673 (C=O), 1603 (C=C), 1060 (C-O); ^1H -NMR (DMSO-d₆, 400 MHz) δ (ppm): 4.96 (1H, s, CH), 7.28 (3H, m, NH₂, H-Ar), 7.47 (4H, m, H-Ar), 7.71 (1H, t, $J = 9.5$, H-Ar), 7.89 (1H, d, $J = 9.5$, H-Ar).

2-Amino-5-oxo-4-phenyl-4,5-dihydropyrano[3,2-*c*]chromene-3-carbonitrile (4j). Light brown solid; mp = 259–261 °C; IR (KBr) $\bar{\nu}$ (cm⁻¹): 3377, 3285 (NH₂), 3180, 2887 (Ar-H), 2196 (C \equiv N),

1709, 1673 (C=O), 1605 (C=C), 1056 (C-O); ¹H-NMR (DMSO-d₆, 400 MHz) δ (ppm): 4.43 (1H, s, CH), 7.24–7.47 (9H, m, NH₂, H-Ar), 7.69 (1H, br s, H-Ar), 7.88 (1H, d, *J* = 6.5, H-Ar).

2-Amino-5-oxo-4-(4-nitrophenyl)-4,5-dihydropyrano[3,2-*c*]chromene-3-carbonitrile (4k). White solid; mp = 252–254 °C; IR (KBr) $\bar{\nu}$ (cm⁻¹): 3335–3479 (NH₂), 3191, 3069 (Ar-H), 2195 (C≡N), 1718, 1672 (C=O), 1602 (C=C), 1505, 1456 (NO₂), 1054 (C-O); ¹H-NMR (DMSO-d₆, 400 MHz) δ (ppm): 4.66 (1H, s, CH), 7.45–7.59 (4H, m, NH₂, H-Ar), 7.72 (1H, t, *J* = 10, H-Ar), 7.90 (1H, d, *J* = 10, H-Ar), 8.16 (1H, d, *J* = 10.5, H-Ar).

2-Amino-4-(4-methoxyphenyl)-5-oxo-4,5-dihydropyrano[3,2-*c*]chromene-3-carbonitrile (4l). Yellow solid; mp = 246–248 °C; IR (KBr) $\bar{\nu}$ (cm⁻¹): 3383, 3319 (NH₂), 3252, 3190, 3064, 2954 (Ar-H), 2202 (C≡N), 1709, 1672 (C=O), 1606 (C=C), 1052 (C-O); ¹H-NMR (DMSO-d₆, 400 MHz) δ (ppm): 3.70 (3H, s, OCH₃), 4.38 (1H, s, CH), 6.85 (2H, d, *J* = 11, H-Ar), 7.15 (2H, d, *J* = 11, H-Ar), 7.36 (2H, br s, NH₂), 7.43 (1H, d, *J* = 10.5, H-Ar), 7.48 (1H, d, *J* = 9.5, H-Ar), 7.69 (1H, t, *J* = 9.5, H-Ar), 7.88 (1H, d, *J* = 10, H-Ar).

4,4'-(1,4-Phenylene)bis(2-amino-5-oxo-4,5-dihydropyrano[3,2-*c*]chromene-3-carbonitrile) (4m). Light yellow solid; mp = >280 °C; IR (KBr) $\bar{\nu}$ (cm⁻¹): 3324 (NH₂), 3191 (Ar-H), 2196 (C≡N), 1709, 1672 (C=O), 1604 (C=C), 1055 (C-O); ¹H-NMR (DMSO-d₆, 400 MHz) δ (ppm): 4.40 (1H, s, CH), 7.26 (4H, br s, NH₂), 7.31 (3H, d, *J* = 6.0 Hz, H-Ar), 7.42 (3H, br s, H-Ar), 7.47 (2H, d, *J* = 10.8 Hz, H-Ar), 7.90 (2H, d, *J* = 6.8 Hz, H-Ar), 7.70 (2H, br s, H-Ar).

2-Amino-4-(4-hydroxy-3-methoxyphenyl)-7-methyl-5-oxo-4,5-dihydropyrano[4,3-*b*]pyran-3-carbonitrile (4n). White solid; mp = 260–262 °C; IR (KBr) $\bar{\nu}$ (cm⁻¹): 3492 (OH), 3349, 3094 (NH₂), 3094 (Ar-H), 2200 (C≡N), 1702, 1673 (C=O), 1639, 1607 (C=C), 1034 (C-O); ¹H-NMR (DMSO-d₆, 400 MHz) δ (ppm): 2.22 (3H, s, CH₃), 3.74 (3H, s, OCH₃), 4.16 (1H, s, CH), 6.24 (1H, s, H-pyran), 6.51 (1H, d, *J* = 9, H-Ar), 6.68 (1H, d, *J* = 10.5, H-Ar), 6.72 (1H, s, H-Ar), 7.12 (2H, br s, NH₂), 8.92 (1H, br s, OH).

2-Amino-7-methyl-4-(3-nitrophenyl)-5-oxo-4,5-dihydropyrano[4,3-*b*]pyran-3-carbonitrile (4o). White solid; mp = 236–238 °C; IR (KBr) $\bar{\nu}$ (cm⁻¹): 3457, 3360 (NH₂), 3237, 3184, 3118, 3076 (Ar-H), 2874, 2195 (C≡N), 1705, 1670 (C=O), 1639, 1609 (C=C), 1473, 1526 (NO₂), 1038 (C-O); ¹H-NMR (DMSO-d₆, 400 MHz) δ (ppm): 2.21 (3H, s, CH₃), 4.54 (1H, s, CH), 6.30 (1H, s, H-pyran), 7.35 (1H, s, H-Ar), 8.03 (2H, s, NH₂), 8.11 (1H, d, *J* = 10, H-Ar).

2-Amino-4-(4-ethoxyphenyl)-7-methyl-5-oxo-4,5-dihydropyrano[4,3-*b*]pyran-3-carbonitrile (4p). White solid; mp = 230–232 °C; IR (KBr) $\bar{\nu}$ (cm⁻¹): 3450, 3401 (NH₂), 3209 (C-H), 3101, 2980 (Ar-H), 2929, 2883, 2195 (C≡N), 1702, 1671 (C=O), 1643, 1610 (C=C), 1042 (C-O); ¹H-NMR (DMSO-d₆, 400 MHz) δ (ppm): 1.28 (3H, t, *J* = 8, CH₃), 2.19 (3H, s, CH₃), 3.96 (2H, q, *J* = 7.5, CH₂), 4.19 (1H, s, CH), 6.24 (1H, s, H-pyran), 6.82 (2H, d, *J* = 10, H-Ar), 7.06 (2H, d, *J* = 10, H-Ar), 7.14 (2H, br s, NH₂).

4,4'-(1,4-Phenylene)bis(2-amino-7-methyl-5-oxo-4,5-dihydropyrano[4,3-*b*]pyran-3-carbonitrile) (4q). Yellowish white solid; mp = >280 °C; IR (KBr) $\bar{\nu}$ (cm⁻¹): 3457, 3323 (NH₂), 3196 (Ar-H), 2891 (aliphatic C-H), 2195 (C≡N), 1704, 1677 (C=O), 1643, 1610 (C=C), 1039 (C-O); ¹H-NMR (DMSO-d₆, 400 MHz) δ (ppm): 2.19 (3H, s, CH₃), 4.22 (1H, s, CH), 6.25 (1H, s, H-pyran), 7.09 (2H, s, NH₂), 7.18 (4H, s, H-Ar).

3-Amino-1-(3-nitrophenyl)-1H-benzof[*f*]chromene-2-carbonitrile (4r). Milky solid; mp = 238–240 °C; IR (KBr) $\bar{\nu}$ (cm⁻¹): 3404, 3356 (NH₂), 3196, 2891 (Ar-H), 2190 (C≡N), 1658 (C=O), 1643, 1610 (C=C), 1527, 1349 (NO₂), 1083 (C-O); ¹H-NMR (DMSO-d₆, 400 MHz) δ (ppm): 5.40 (1H, s, CH), 7.20 (2H, s, NH₂), 7.42 (2H, d, *J* = 9.01 Hz, Ar-H), 7.51–7.57 (2H, m, Ar-H), 7.63 (1H, d, *J* = 7.74 Hz, Ar-H), 7.78 (1H, d, *J* = 9.11 Hz, Ar-H), 7.93 (1H, d, *J* = 9.06 Hz, Ar-H), 8.01 (1H, d, *J* = 8.01 Hz, Ar-H), 8.06 (1H, s, Ar-H), 8.05 (1H, d, *J* = 1.75 Hz, Ar-H).

3-Amino-1-(*p*-tolyl)-1H-benzof[*f*]chromene-2-carbonitrile (4s). White solid; mp = 268–270 °C; IR (KBr) $\bar{\nu}$ (cm⁻¹): 3404, 3356 (NH₂), 3079 (Ar-H), 2190 (C≡N), 1658 (C=O), 1615 (C=C), 1035 (C-O); ¹H-NMR (DMSO-d₆, 400 MHz) δ (ppm): 2.17 (3H, s, CH₃), 5.22 (1H, s, CH), 6.25 (1H, s, CH), 6.94 (1H, br s, H-Ar), 7.04 (4H, br s, H-Ar), 7.30–7.40 (8H, m, H-Ar, NH₂), 7.80–7.89 (3H, m, H-Ar).

Results and discussion

Catalyst characterization results

The structural properties of catalyst nano-cellulose/Ti^(IV)/Fe₃O₄ was determined by FT-IR, XRD, FESEM, TEM, TG-DTA, EDX, BET analysis and VSM analysis. Analysis (FT-IR) was performed to investigate the structure of the catalyst and to identify the positions of Lewis acid on the surface of the catalyst. The infrared spectra of (a) Fe₃O₄, (b) nano cellulose/Ti^(IV), and (c) nano-cellulose/Ti^(IV)/Fe₃O₄ nano-particles are shown in Fig. 1.

Fig. 1 FT-IR spectra of: (a) Fe₃O₄, (b) nano cellulose/Ti^(IV) and (c) nano-cellulose/Ti^(IV)/Fe₃O₄ nanoparticles.

Fig. 2 XRD patterns of nano-cellulose/Ti^(IV)/Fe₃O₄.

Fig. 3 FESEM image of nano-cellulose/Ti^(IV)/Fe₃O₄.

Fig. 4 TEM image of nano-cellulose/Ti^(IV)/Fe₃O₄.

As the figure shows, in all spectra, the signal in 3100–3500 cm^{−1} indicates the stretching vibration of O–H; the signal in 1100 cm^{−1} indicate the vibration C–O band. In the nano-cellulose/Ti^(IV)/Fe₃O₄ infrared spectrum, the bands of 539 cm^{−1}, 1031 cm^{−1}, and 3392 cm^{−1} are related to the vibrations of Fe–O, C–O and O–H, respectively.

The XRD pattern of the nano-cellulose/Ti^(IV)/Fe₃O₄ catalyst is shown in Fig. 2. The broad peak of 2θ at 20–21 indicate the presence of cellulose. The observed peak 12, 30, 35, 37, 44, 57, 64 indicate the presence of Fe₃O₄ moiety in catalyst. The signals at 25, 38, 49, 55 and 63 are similar to the XRD signals for TiO₂. These observed signals approve the structure of nano-cellulose/Ti^(IV)/Fe₃O₄.

The morphology of the catalyst particles was determined by scanning electron microscopy. The FESEM image of the nano-cellulose/Ti^(IV)/Fe₃O₄ catalyst is shown in Fig. 3. The spherical

Fig. 5 Thermal gravimetric analysis pattern of nano-cellulose/Ti^(IV)/Fe₃O₄ catalyst.

Fig. 6 VSM images of (a) Fe₃O₄ and (b) nano-cellulose/Ti^(IV)/Fe₃O₄.

shape of the nano-particles is clearly visible in the image. In addition, the particle size in the FESEM model was about 25 nm.

The TEM image of the nano-cellulose/Ti^(IV)/Fe₃O₄ catalyst is shown in Fig. 4. By using this technique, the average size of the catalyst is obtained, which shows the size of nano-particles at about 25 nm.

By thermal gravimetric analysis, the mass change of the catalyst can be measured as a function of temperature in the scanned state, or as a function of time in the isothermal state.

Thermal changes associated with catalyst mass change such as decomposition, sublimation, reduction, adsorption and evaporation are measured in TGA. The thermal gravimetric decomposition pattern of the nano-cellulose/Ti^(IV)/Fe₃O₄ catalyst from 50 to 400 °C is shown in Fig. 5. As shown in the figure, the nano-cellulose/Ti^(IV)/Fe₃O₄ catalyst at 100 °C shows only 5% weight loss due to moisture loss. The catalyst is also stable at temperatures above 100 °C and can be used in high temperature organic reactions.

VSM of Fe₃O₄ and nano-cellulose/Ti^(IV)/Fe₃O₄ at room temperature are shown in Fig. 6. The decrease in the magnetic

saturation of the nano-cellulose/Ti^(IV)/Fe₃O₄ catalyst compared to Fe₃O₄ is due to the presence of non-magnetic material (cellulose) with Fe₃O₄ nano-particles. Despite this reduction in magnetic saturation, the catalyst can still be separated from the solution by an external magnetic field.

In this study, cellulose/Ti^(IV)/Fe₃O₄ catalyst was applied for synthesis of chromenes *via* reaction of aromatic aldehydes, malononitrile and β-diketone. In order to determine the best conditions for the reaction, first the multicomponent reaction of benzaldehyde (1 mmol), dimedone (1 mmol) and malononitrile (1.1 mmol) was selected as the model reaction.

^a RTIL: room-temperature ionic liquids; Bis-Su: 1,1'-(butane-1,4-diyl)bis(pyrrolidine-2,5-dione); PANF-D: polyacrylonitrile fiber.

Progression of the reaction was followed by thin layer chromatography (TLC). This reaction was performed for different conditions; the results are shown in Table 1. The results of Table 1 show that the optimum amount of nano-cellulose/Ti^(IV)/Fe₃O₄ catalyst with this method is 0.05 g per 1 mmol of other materials. The optimum conditions for the reaction is solvent-free at 70 °C. According to Table 1, TiO₂ can also promote the reaction well, but because it is not magnetic, its workup is more difficult. Meanwhile, cellulose and cellulose/Fe₃O₄ can not promote the reaction well.

According to modified conditions, a number of chromenes derivatives were prepared in the presence of 0.05 g of nano-cellulose/Ti^(IV)/Fe₃O₄ catalyst under solvent free at 70 °C (Table 2). In all of these studied examples, the aldehyde derivatives bearing either electron donating or electron withdrawing substituent reacted smoothly to give the corresponding chromenes in excellent yields.

Using 2,6-dichlorobenzaldehyde as an aldehyde with steric hindrance, caused addition in time and reduction in yield of reaction (Table 2, entry 20).

One of the important features of solid acid catalysts is their reusability. The results showed that the catalyst was reused 7 times in the preparation of **4a** with low reduction in activity. The results are shown in Fig. 7. The best number run for reusability is 5 run with 4% reduction in yield of **4a**.

The efficiency of nano-cellulose/Ti^(IV)/Fe₃O₄ catalyst in the synthesis of **4a** was compared with other reported catalysts and the data were shown in Table 3. According to these results, our catalyst is a suitable catalyst with high efficiency.

In preparation of **4a**

A plausible mechanism for synthesis of chromens in the presence of nano-cellulose/Ti^(IV)/Fe₃O₄ is shown in Scheme 1. According to this mechanism, the titanium section of catalyst activates the carbonyl group of aldehyde (**1**) to react with malononitrile (**2**) to form condensation product (**3**). The enol form of dimedone is added to **3** via Michael addition to form intermediate **7**. By internal proton transfer, the intermediate **8** and then by cyclization, the intermediate **9** is formed. The product **10** is produced from **9** via tautomerization.

Conclusion

We have described the synthesis of nano-cellulose/Ti^(IV)/Fe₃O₄ as a core-shell nano-catalyst which was used for the one-pot synthesis of various chromens at 70 °C under solvent-free conditions. Due to simple preparation heterogeneous nature of the catalyst, solvent free mild reaction conditions, higher yields, and recovery capability, it can be concluded that nano-cellulose/Ti^(IV)/Fe₃O₄ shows very high activity. The catalyst is reused several times, while generally maintaining the same reaction yield.

Scheme 1 A plausible mechanism for synthesis of chromens in the presence of nano-cellulose/Ti^(IV)/Fe₃O₄.
