Synthesis and structural chemistry of bicyclic hexaaza-dithia macrocycles containing pendant donor groups†

Mathias Gressenbuch, Ulrike Lehmann and Berthold Kersting*

A short and efficient synthesis of a series of macrobicyclic aza-thioethers with pendant allyl (8, 13, 14), cyanethyl (15), 3-aminopropyl (16), 2-methoxyacetyl (17, 19), 2-methoxyethyl (18, 20), and tertbutyloxycarbonyl substituents (22, 23) has been achieved. The parent macrobicycles 1 and 2 are readily alkylated without overalkylation and without affecting the masked thiolate functions. The protocol is also feasible for the synthesis of macrobicycles with different alkyl groups on the benzylic and central nitrogen atoms of the linking diethylene triamine units. The identity of the compounds was substantiated using ESI MS, FT-IR, ¹H-NMR, and ¹³C-NMR spectroscopy. The crystal and molecular structures of six compounds (8, 15, 17·3DMSO, 19·2DMSO·2H₂O, 20 and 23) were additionally solved. The macrocycles are rather flexible and can adopt folded or stepped conformations. The ability of the compounds to form inclusion complexes with DMSO is also demonstrated. The crystal structures are governed by extensive inter- and intramolecular $CH \cdots \pi$ interactions.

Introduction

The synthesis of macrocyclic ligands with pendant donor arms is highly desirable in view of a range of potential applications such as catalysis, selective cation binding, biomimetic chemistry, and radionuclide therapy. 1-5 Thus, the chemistry of aliphatic polyaza-macrocycles has been well investigated as has the chemistry of their corresponding thia analogs. Many monocyclic macrocycles with side arms terminated with N, O, S, or P donor groups have been prepared and their coordination chemistry investigated. 6,7 Surprisingly, the chemistry of multidentate macrocycles with mixed N and S donor functions has received much less attention.8-10 This is true in particular for the families of amine-thioether ligands containing aromatic thioether groups. 11-13 An early example is the 14-membered aromatic N2S2 macrocycle, which was described by Lindoy and co-workers. 14,15 Until now only few more ligands of this sort have been reported in the literature. 16-23

Our group has reported the synthesis of the macrobicyclic azathioethers 124 and 225 and of some alkylated derivatives 3-5 (Fig. 1). 26,27 More recently, we have reported the first examples

of bicyclic aminothioethers bearing pendant hydroxyethyl groups (6, 7).²⁸ The structures of the free macrocycles 3,²⁹ 4,²⁵ 5,27 and 628 have been determined. The macrocycles adopt a folded conformation in which the two aryl rings and the alkyl residues forming a cavity. However, none of these structures are clathrate, nor inclusion, complexes. As part of this program, we sought to extend our exploration to other variants of this versatile ligand system. To our knowledge, there are no systematic investigations on such hexaaza-thioether macrocycles. We have obtained a series of new macrobicyclic compounds bearing olefinic, nitrile, amine, and methoxy groups in place of the alkyl functions. Herein, we describe their synthesis and solid state structures. The effect of the pendant groups on the structural features is discussed, and compared with those of the parent ligand systems 1-3.

Experimental section

Paper

Materials and physical measurements

The bicyclic aza-thioethers 1²⁴ and 2, ²⁵ 1,2-bis(4-*tert*-butyl-2,6-diformylthioethane) (10), ²⁴ bis(2-phthalimidoethyl)amine³⁰ (11), and *tert*-butyl-bis(2-aminoethyl)carbamate (21)³¹ were prepared according to literature. Melting points were determined with an Electrothermal IA9000 series instrument using open glass capillaries and are uncorrected. Mass spectra were obtained using the positive ion electrospray ionization modus (ESI) on a FT-ICR-MS Bruker Daltronics APEX II instrument. NMR spectra were recorded on a Bruker DRX-600, Bruker DRX-400 or Varian Mercury plus 400 spectrometer. Chemical shifts refer to solvent signals. The atom labels used to assign the NMR signals are not identical with those used in the X-ray structures. Elemental analyses were carried out with a VARIO EL – elemental analyzer.

Synthesis and analysis of compounds

The corresponding spectra for the IR, ¹H-NMR, ¹³C-NMR are included in the ESI,† for each of the synthetized compounds. A summary of the obtained results are shown here.

Hexaallylated aza-thioether 8. The thioether 1 (307 mg, 0.50 mmol) and allyl bromide (372 mg, 3.07 mmol) were dissolved in EtOH (3 mL). A solution of triethylamine (303 mg, 3.00 mmol) in EtOH (1 mL) was added dropwise and the mixture was allowed to stand for 2 weeks at 0 °C. The mixture was decanted off from the resulting HNEt₃Br. Crystals of the title compound crystallized from the mother liquor upon standing in air. Yield: 392 mg (0.46 mmol, 92%), colorless solid. M.p. 170-172 °C. Found: C 72.90, H 9.32, N 9.84, S 7.21; C₅₂H₈₀N₆S₂ (853.37) requires: C 73.19, H 9.45, N 9.85, S 7.51. m/z (ESI+, MeOH): $C_{52}H_{80}N_6S_2$ (852.59) [M + H⁺]⁺ calcd: 853.60; found 853.60. IR (KBr): $\nu/\text{cm}^{-1} = 3443 \text{ w}$, 3078 w, 3004 w, 2962 vs, 2927 m, 2904 m, 2867 m, 2810 vs, 2712 vw, 1843 vw, 1643 w, 1593 w, 1559 vw 1477 w, 1459 w, 1442 w, 1418 w, 1404 w, 1358 m, 1260 m, 1242 w, 1229 w, 1153 w, 1100 s, 1023 vw, 993 m, 963 w, 917 vs, 900 vw, 863 vw, 801 vw, 734 vw, 690 vw, 639 vw, 600 vw, 573 vw. ¹H-NMR (400 MHz, CDCl₃): $\delta = 1.31$ (s, 18 H, C(CH₃)₃), 2.60 (m, 16 H, (NCH₂CH₂N)), 2.74 (s, 4 H, SCH₂), 2.97 (d, 8 H, $^{3}J = 6.4 \text{ Hz}, \text{ NC}H_{2}\text{CHCH}_{2}, 3.10 \text{ (d, 4 H, } ^{3}J = 6.4 \text{ Hz}, \text{ NC}H_{2}\text{CHCH}_{2},$ 3.70 (s, 8 H, ArC H_2), 5.05–5.18 (m, 12 H, CH = C H_2), 5.82 (m, 6 H, $CH = CH_2$, 7.50 (s, 4 H, ArH). ¹³C₁¹H}-NMR (100 MHz, CDCl₃): $\delta = 31.60 \text{ (C(CH_3)_3)}, 34.98 \text{ (C(CH_3)_3)}, 35.82 \text{ (SCH_2)_2}, 50.89$ ((NCH₂CH₂)₂N), 51.71 ((NCH₂CH₂)₂N), 56.88 (ArCH₂NCH₂CHCH₂), 57.51 (ArCH₂), 59.23 (NCH₂CHCH₂), 116.99 (ArCH₂NCH₂CH= CH_2), 117.46 (NCH₂CH= CH_2), 124.86 (ArC-3,3'), 128.18 (ArC-2,2'), 136.35 (ArCH₂NCH₂CH=CH₂), 136.34 (CH=CH₂), 143.71 (ArC-1), 151.40 (ArC-4). This compound was additionally characterized by X-ray crystallography.

Tetraallylated aza-thioether 9. The thioether 2 (641 mg, 1.00 mmol) and allyl bromide (509 mg, 4.21 mmol) were dissolved in EtOH (3 mL). A solution of triethylamine (404 mg, 4.00 mmol) in EtOH (1 mL) was added dropwise and the mixture was allowed to stand for 2 weeks at 0 $^{\circ}$ C. HNEt₃Br crystallized, from which the reaction mixture was decanted off. The title compound precipitated from the mother liquor upon standing in air.

This material was further purified by recrystallization from MeCN/CH₂Cl₂. Yield: 649 mg (0.46 mmol, 81%), colorless solid. Found: C 72.0, H 9.42, N 9.94, S 7.81; C₄₈H₇₆N₆S₂ (801.30) requires: C 71.95, H 9.56, N 10.49, S 8.00. m/z (ESI+, MeOH): $C_{48}H_{76}N_6S_2$ (800.56) [M + H⁺]⁺ calcd: 801.57; found 801.60. IR (KBr): $\nu/\text{cm}^{-1} = 3425 \text{ w}$, 3072 w, 3004 w, 2962 vs, 2927 m, 2907 s, 2867 m, 2810 s, 2787 s, 2703 m, 1829 vw, 1641 w, 1594 w, 1559 vw 1477 m, 1459 s, 1415 m, 1357 s, 1330 m, 1311 m, 1262 vs, 1216 w, 1194 w, 1154 s, 1106 vs, 1035 vs, 992 s, 980 m, 914 s, 883 m, 801 vs, 741 vw, 687 w. ¹H-NMR (400 MHz, CDCl₃): $\delta = 1.21$ (s, 18 H, C(CH₃)₃), 2.21 (s. 6 H, CH₃), 2.50-2.59 (m, 16 H, NCH₂CH₂N), 2.85 (m, 8 H, NCH₂CHCH₂), 2.87 (s, 4 H, SCH_2), 3.76 (s, 8 H, ArC H_2), 5.02–5.10 (m, 8 H, NC H_2 CHC H_2), 5.74 (m, 4 H, $CH = CH_2$), 7.37 (s, 4 H, ArH). $^{13}C{^1H}-NMR$ (100 MHz, CDCl₃): $\delta = 31.39$ (C(CH₃)₃), 34.76 (C(CH₃)₃), 36.69 (SCH₂)₂, 42.94 (CH₃), 51.16 ((NCH₂CH₂)₂N), 55.17 $((NCH_2CH_2)_2N)$, 56.58 $(NCH_2CH=CH_2)$, 57.91 $(ArCH_2)$, 117.50 $(CH = CH_2)$, 125.73 (ArC-3,3'), 129.31 (ArC-2,2'), 135.42 $(CH = CH_2)$, 143.78 (ArC-1), 151.24 (ArC-4). This compound was additionally characterized by X-ray crystallography.

N-Allyl-bis(2-phthalimidoethyl)-amine (12). A mixture of bis(2phthalimidoethyl)-amine 11 (25.0 g, 68.8 mmol), K₂CO₃ (9.51 g, 68.8 mmol), and allyl bromide (11.6 g, 9.59 mmol) in 700 mL of THF was stirred for 30 min at room temperature and for 12 h at 50 °C. The resulting mixture was filtered, and concentrated in vacuum to one fourth of its original volume. The resulting crystals were collected and dried under vacuum. Yield: 15.5 g, 56%, mp 132 °C. Found: C 68.19, H 5.54, N 10.34; C₂₃H₂₁N₃O₄ (403.44) requires: C 68.47, H 5.25, N 10.42. IR (KBr): ν /cm⁻¹ = 3461 w, 3091 vw, 3018 vw, 2955 w, 2835 w, 1769 s, 1711 vs, 1611 m, 1468 s, 1438 s, 1404 s, 1387 vs, 1332 m, 1306 m, 1276 w, 1191 w, 1160 vw, 1142 w, 1088 m,1041 m, 1018 s, 974 w, 939 w, 874 w, 803 w, 773 vw, 726 vs, 630 w, 613 w, 567 vw, 532 m, 469 vw. ¹H-NMR (400 MHz, CDCl₃): $\delta = 2.74$ (t, $^{3}J = 6.4$ Hz, 4 H, (NCH₂CH₂)₂N, 3.15 (d, $^{3}J = 6.4 \text{ Hz}, 2 \text{ H}, \text{ } \text{C}H_{2}\text{C}\text{H} = \text{C}\text{H}_{2}, 3.67 \text{ (t, }^{3}J = 6.4 \text{ Hz}, 4 \text{ H},$ $(NCH_2CH_2)_2N$, 4.98–5.08 (dd, 1 H, $^3J = 16.4$ Hz, $^3J = 10.4$ Hz, CH=CH₂), 5.56-5.63 (m, 2 H, CH=CH₂), 7.60-7.67 (m, 8 H, ArH). $^{13}\text{C}^{1}\text{H}$ -NMR (100 MHz, CDCl₃): $\delta = 36.30 \text{ (NCH}_{2}\text{CH}_{2})_{2}\text{N}$, 51.90 (NCH₂CH₂)₂N, 57.03 (CH₂CH=CH₂), 118.47 (CH=CH₂), 123.59 (ArC-2,2'), 132.73 (ArC-1,1'), 133.96 (ArC-3,3'), 135.56 $(CH = CH_2)$, 168.74 (CO).

N-Allyl-bis(2-aminoethyl)-amine trihydrochloride (13·3HCl). A suspension of *N*-allyl-bis(2-phthalimidoethyl)-amine (15.6 g, 38.7 mmol) was dissolved in 200 mL of concentrated HCl and refluxed for 2 days. The clear solution was cooled and filtered. The clear solution was concentrated in vacuum, to give a brown oil, which was washed with THF. The oil was separated and dried under vacuum to give a colorless, hygroscopic solid. The compound could not be obtained in analytically pure form but was found pure enough for the next step. Yield: 8.16 g (83%). IR (KBr): ν /cm⁻¹ = 3415 m, 2963 vs, 2039 w, 1602 m, 1471 s, 1372 m, 1262 s, 1099 vs, 1019 vs, 959 s, 869 w, 801 vs, 662 vw, 603 vw, 461 w. ¹H-NMR (400 MHz, D₂O): δ = 3.45 (m, ³*J* = 6.4 Hz, 4 H, (H₂NCH₂), 3.52 (t, ³*J* = 6.4 Hz, 4 H, (CH₂)₂N), 3.89 (d, ³*J* = 7.2 Hz, 2 H, NCH₂CH=CH₂), 5.67 (m, 1 H, CH=CH₂), 5.93 (m, 2 H, CH=CH₂). ¹³C{¹H}-NMR (100 MHz,

NJC

 $(CH = CH_2)$, 128.2 $(CH = CH_2)$.

 D_2O): $\delta = 34.0 \ (H_2NCH_2), \ 49.6 \ ((CH_2)_2N), \ 56.3 \ (NCH_2), \ 124.8$

N-Allyl-bis(2-aminoethyl)-amin (13). A suspension of *N*-allyl-bis(2-aminoethyl)-amine-trihydrochloride (9.76 g, 38.6 mmol) and KOC(CH₃)₃ (13.0 g, 116 mmol) in 50 mL of THF was stirred at 55 °C for 3 d and filtered. The THF was removed in vacuum to give an oil, which was purified by distillation in vacuum. Yield: 5.25 g (89%). The compound is hygroscopic and could not be obtained in analytically pure form. The compound was found pure enough for the next step. IR (KBr): ν/cm^{-1} = 3405 vs, 3072 s, 2933 vs, 2360 m, 2343 m, 1572 vs, 1479 vs, 1384 m, 1309 s, 1147 w, 1090 w, 1038 w, 997 w, 920 m, 859 m, 679 s. ¹H-NMR (400 MHz, CD₃OD): δ = 2.54 (t, 3J = 6.0 Hz, 4 H, (H₂NC*H*₂), 2.69 (t, 3J = 6.0 Hz, 4 H, (C*H*₂)₂N), 3.14 (d, 3J = 6.4 Hz, 2 H, NC*H*₂CH=CH₂), 5.17 (m, 1 H, CH=CH₂), 5.89 (m, 2 H, CH=CH₂). ¹³C{¹H}-NMR (100 MHz, CD₃OD): δ = 38.57 (H₂NC*H*₂), 55.96 ((CH₂)₂N), 57.12 (NCH₂), 116.70 (CH=CH₂), 135.27 (CH=CH₂).

Bisallylated aza-thioether 14. A solution of N-allyl-bis(2aminoethyl)-amine 13 (702 mg, 4.61 mmol) in EtOH (150 mL, 3:1, v:v) and a solution of 1,2-bis(4-tert-butyl-2,6-diformylphenylthio)ethane 10 (1.08 g, 2.30 mmol) in CH₂Cl₂ (500 mL) were added simultaneously over the course of 3 h into a EtOH/ CH₂Cl₂ (600 mL, 1:3 v:v) solvent mixture. After the resulting mixture was stirred for further 2 d, the CH2Cl2 solvent was removed under reduced pressure. Sodium borohydride (690 mg, 18.24 mmol) was added and the mixture was stirred at r.t. for another 2 h. The excess reducing agent was destroyed by adding HCl conc (final pH = 1). The mixture was subsequently evaporated to dryness, re-dissolved in CH₂Cl₂/H₂O (100 mL, 1:1 v:v), and the pH was adjusted to \sim 13 with aqueous KOH (5 M). After stirring for 2 h, the layers were separated and the aqueous phase was extracted with dichloromethane (4 × 150 mL). The organic fractions were combined and dried with anhydrous K₂CO₃. Evaporation of the solvent gave a foam, which was recrystallized from EtOH to give 1.41 g (88%) of the title compound. Found: C 68.90, H 9.29, N 12.29, S 9.11; C₄₀H₆₄N₆S₂ (693.11) requires: C 69.32, H 9.31, N 12.13, S 9.25. IR (KBr): $\nu/\text{cm}^{-1} = 3424 \text{ m}$, 3261 m, 2955 vs, 2902 s, 2867 s, 2803 vs, 1599 m, 1577 m, 1451 vs, 1417 s, 1366 s, 1330 w, 1293 w, 1262 m, 1230 w, 1205 m, 1149 s, 1094 s, 1054 s, 1029 s, 921 m, 897 w, 804 s. ¹H-NMR (300 MHz, CDCl₃): $\delta = 1.30$ (s, 18 H, $C(CH_3)_3$, 2.81 (s, 4 H, SCH_2), 2.96 (m, 8 H, $(NCH_2CH_2)_2N$), 3.14 (m, 8 H, $(NCH_2CH_2)_2N$), 3.30 (d, J = 6.6 Hz, 4 H, $CH_2CH = CH_2$), 4.12 (s, 8 H, ArCH₂), 5.21 (m, 2 H, CH=CHH), 5.23 (m, 2 H, CH=CHH), 5.90 (m, 2 H, CH=CH₂), 6.32 (s (br), 4 H, NH), 7.72 (s, 4 H, ArH). ${}^{13}C\{{}^{1}H\}$ -NMR (75 MHz, CDCl₃): $\delta = 31.36$ $(C(CH_3)_3)$, 35.20 $(C(CH_3)_3)$, 37.58 $(SCH_2)_2$, 49.02 $((NCH_2CH_2)_2N)$, 50.31 ((NCH₂CH₂)₂N), 51.41 (ArCH₂), 60.20 (NCH₂CH=CH₂),119.32 (CH=CH₂), 128.34 (ArC-3,3'), 130.07 (ArC-2,2'), 134.56 (CH=CH₂), 140.16 (ArC-1), 154.18 (ArC-4).

Hexa-(cyanoethylated) azathioether 15. The thioether 1 (4.67 g, 7.62 mmol) was dissolved in acrylonitrile (3 mL) and the resulting mixture was stirred for 3 d at 80 $^{\circ}$ C. The excess acrylonitrile was evaporated, and the yellow solid was dissolved in 100 mL of a 2:1 CH₂Cl₂/CH₃CN solvent mixture. Evaporation of the CH₂Cl₂ provided a colorless solid, which was filtered and dried in air.

Yield: 7.08 g (7.6 mmol, 99%), colorless solid. M.p. 170-172 °C. Found: C 66.83, H 7.92, N 17.82; C₅₂H₇₄N₁₂S₂ (931.37) requires: C 67.06, H 8.01, N 18.05. m/z (ESI+, MeOH): C₅₂H₇₄N₁₂S₂ (930.56) $[M + H^{+}]^{+}$ calcd: 931.57; found 931.56. IR (KBr): ν/cm^{-1} = 3426 vw, 3054 m, 2951 vs, 2818 vs, 2246 vs $\nu(\text{CN})$, 1593 m, 1556 vw, 1477 m, 1464 s, 1434 s, 1424 s, 1405 m, 1381 m, 1356 s, 1328 m,1292 m, 1276 s, 1248 m, 1215 m, 1171 w, 1139 s, 1110 vs, 1047 s, 1005 m, 987 m, 961 m, 947 m, 887 s, 832 w, 801 vw, 774 m, 733 m, 704 vw, 681 vw, 650 w, 596 w. ¹H-NMR (300 MHz, CDCl₃): $\delta = 1.33$ (s, 18 H, ArC(CH₃)₃), 2.38 (m, 8 H, CH_2CN), 2.40 (m, 4 H, CH_2CN), 2.66 (m, 8 H, $(NCH_2CH_2)_2N$, 2.67 (s, 4 H, SCH_2), 2.68 (m, 8 H, $(NCH_2CH_2)_2N$), 2.73 (m, 8 H, CH₂CH₂CN), 2.78 (m, 4 H, CH₂CH₂CN), 3.76 (s, 8 H, ArC H_2), 7.53 (s, 4 H, ArH). ¹³C{¹H}-NMR (75 MHz, $CDCl_3$): $\delta = 17.03$ (CH₂CN), 17.38 (CH₂CN), 31.46 (C(CH₃)₃), 35.00 $(C(CH_3)_3)$, 36.16 (SCH_2) , 47.3 $(ArCH_2NCH_2CH_2CN)$, $51.82 (CH_2CH_2CN)$, $52.39 ((NCH_2CH_2)_2N)$, $52.96 ((NCH_2CH_2)_2N)$, 63.1 (ArCH₂N), 118.90 (ArCH₂NCH₂CH₂CN), 118.96 (CN), 125.20 (ArC-3,3'), 128.17 (ArC-2,2'), 142.71 (ArC-1), 152.26 (ArC-4). This compound was additionally characterized by X-ray crystallography.

Hexa(3-aminopropylated) aza-thioether 16. A suspension of LiBH₄ (0.48 g, 22 mmol), Me₃SiCl (4.45 g, 41 mmol), and the nitrile 15 (0.50 g, 0.54 mmol) in 300 mL of dry THF was stirred for 10 h at 50 °C. The mixture was refluxed for further 12 h, cooled to r.t., and quenched with MeOH to give a clear solution. The solution was stirred for 1 h, evaporated to dryness, and suspended in 40 mL of 3 M NaOH solution. The aqueous phase was extracted with CH₂Cl₂ (4 × 20 mL). The organic fractions were combined and dried with anhydrous K2CO3. Evaporation of the solvent gave 16 as a colorless solid (376 mg, 73%). The compound is hygroscopic and could not be obtained in analytically pure form, but the spectroscopic data (see ESI†) prove the formulation of this compound. m/z (ESI+, MeOH): $C_{52}H_{98}N_{12}S_2$ (955.56) $[M + H^{\dagger}]^{+}$ calcd: 955.76; found 955.76. Dicarbamoylated macrobicycle 22. To a solution of tert-butyl bis(2-aminoethyl)carbamate (2.89 g, 14.22 mmol) in EtOH/ CHCl₃ (800 mL, 3:1 v/v) at 0 °C was added a solution of 1,2bis(4-tert-butyl-2,6-diformylphenylthio)ethane (3.34 g, 7.11 mmol) in CHCl₃ (500 mL) over the course of 8 h. After the resulting mixture was stirred for further 2 d, the CHCl₃ solvent was removed under reduced pressure. Sodium borohydride (2.15 g, 56.88 mmol) was added and the mixture was stirred at r.t. for 18 h. The mixture was evaporated to dryness, then redissolved in CH2Cl2/H2O (100 mL, 1:1, v/v), and the pH was adjusted to \sim 13 with aqueous KOH (5 M). After stirring for 2 h, the layers were separated and the aqueous phase was extracted with CH_2Cl_2 (4 × 50 mL). The organic fractions were combined and dried with anhydrous MgSO4. Evaporation of the solvent gave an oil, which crystallized from EtOH (10 ml) after standing for 4 weeks. Yield: 1.20 g (1.47 mmol, 21%). M.p. 136–138 °C. Found: C 64.75, H 8.58, N 9.75; C₄₄H₇₂- $N_6O_4S_2$ 0.5 EtOH (813.21 + 23.04) requires: C 64.63, H 9.04,

Crystallography

Suitable single crystals of compounds 8, 15, 17.3DMSO, 19. 2DMSO·2H₂O, 20, and 23 were selected and mounted on the tip of a glass fibre using perfluoropolyether oil. The data sets for 8, 17-3DMSO, 19-2DMSO-2H₂O, and 20 were collected at 183(2) K using a STOE IPDS-2 diffractometer, while those for 15 and 23 were collected on a STOE IPDS-1 diffractometer at 213(2) K. Graphite monochromated Mo- K_{α} radiation ($\lambda = 0.71073 \text{ Å}$) was used throughout. The data were processed with the programs XAREA.³² Selected details of the data collection and refinement are given in Table 1. The structures were solved by direct methods³³ and refined by full-matrix least-squares techniques on the basis of all data against F^2 using SHELXL-97.³⁴ PLATON was used to search for higher symmetry.35 All non-hydrogen atoms were refined anisotropically, except for those of some disordered solvate molecules. Disorder was modelled using split atom models with restrained Cl-O, O···O, C-C, and C···C distances using appropriate SADI instructions implemented in the SHELXL software package. Graphics were produced with Ortep3 for Windows and PovRAY.

In the crystal structure of 8 two allyl (N1, C18, C19, C20; C21, C22, C23) and one ethylene group (C12, C13) were found to be disordered over two sites. The site occupancies of one allyl and one ethyl group were fixed (0.74/0.26). The site occupancies of the other allyl group were refined (0.55/0.45). In the crystal structure of 17-3DMSO one DMSO solvate molecule (S5, O15, C57, C58) was found to be heavily disordered and was therefore removed from the structure (and the corresponding F_0) with the Squeeze procedure implemented in the PLATON program suite. Removing the DMSO molecule led to a solvent accessible void of 257 Å³, in good agreement with the space needed by one DMSO molecules. The solvate molecules in 19·2DMSO·2H₂O were also found to be heavily disordered and were therefore removed utilizing the SQUEEZE procedure. This led to solvent accessible voids of 628 Å³, attributed to the space needed for two DMSO and two H2O molecules.

Results and discussion

Synthesis

Scheme 1 depicts the synthetic procedures for compounds 8, 9, and 15-20. The reaction of 1 with allylbromide in the presence of NEt₃ in ethanol furnished the bicycle 8 in good yields (>81%). To prevent overalkylation the reaction was carried out at 0 °C. Under similar conditions, the dimethylated precursor 2 reacted preferentially in the benzylic position providing the

Scheme 1 Synthesis of compounds 8, 9, and 15-20

corresponding tetraallylated system 9 (75%) as colorless needles after recrystallization from CHCl₃/EtOH. The reductive amination of tetraaldehyde 10 with N^1 -(3-aminopropyl)- N^1 methylpropane-1,3-diamine 13 under medium-dilution conditions provided the bis-allylated macrocycle 14 in excellent yield (Scheme 2).

The second ligand system was prepared according to a protocol used for the cyanethylation of tetraazacycloalkanes.³⁶ Thus, Michael addition of 1 to acrylonitrile led quantitatively to the hexacyanethylated product 15, which can be easily purified by recrystallization. It was reported that the nitrile functions of tetra(2-cyanoethyl)tetraazacycloalkanes can be reduced to the corresponding primary amines by reduction with LiAlH4, diborane

Scheme 2 Synthesis of compounds 14 and 22-24.

or H₂-RANEY[®]-Nickel.^{37–39} In our hands, the nitrile 15 failed to react in this fashion. Therefore, an alternative protocol involving reduction with LiBH₄/Me₃SiCl was employed.⁴⁰ This sequence provided the hexa(3-aminopropylated) macrocycle 16 in moderate to good yields.

The route used for the synthesis of the amino-thioethers with methoxymethyl substituent is depicted in Scheme 1. A reaction sequence similar to that developed for similar N₆S₂-type macrocycles bearing "innocent" alkyl groups was employed. Key-step of this procedure is the acylation of 1 with 2-methoxyacetyl chloride. Thus, in reaction with 2-methoxyacetyl chloride the amide 17 was generated quantitatively and then reduced to 18 with LiBH₄/Me₃SiCl. As an illustration of the utility of this sequence, the N,N'-dimethyl derivative 2 was also quantitatively derivatized giving the bicyclic macrocycles 19 and 20, respectively.

NJC Paper

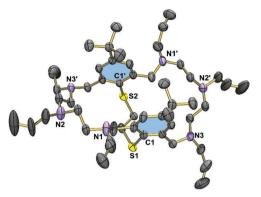

Fig. 2 Molecular structure of 8 in the crystal with atomic numbering for key atoms. Thermal ellipsoids are drawn at the 50% probability level. Hydrogen atoms have been omitted for clarity. Symmetry code used to generate equivalent atoms: 1 - x, y, 0.5 - z.

So far only the precursors 1 and 2 had been utilized for functionalization. In reactions with 1 all six NH donors are derivatized, while modifications of 2 involved only the benzylic NH donors. We decided to develop a method that allows the selective functionalization of the two central NH donors. In an orienting experiment, the reductive amination of the tetraaldehyde 1 with tert-butyl-bis(2-aminoethyl)carbamate 21 was undertaken. This provided the desired macrocycle 22, albeit in low yield. Having succeeded with the preparation of 22, alkylation of the N-benzyl functions and deprotection of the carbamoyl groups could be examined. Indeed, 22 readily underwent reductive methylation with formaldehyde and NaBH3CN to give the tetramethylated derivative 23 in 75% yields, which was fully characterized including X-ray crystallography. Finally, deprotection of 23 with trifluoroacetic acid gave the desired amine 24.

All new compounds were characterized by elemental analysis, IR, ¹H and ¹³C NMR spectroscopy. Some compounds were further characterized by X-ray crystallography, in order to study their host-guest chemistry.

Crystal structures

Fig. 2 displays the molecular structure of the hexaallylated macrocycle 8. The molecule has crystallographically imposed C₂ symmetry, and adopts a folded conformation. Unlike in the permethylated derivative 3,29 the two aromatic rings are essentially coplanar, but are twisted about the S1···S1' vector (torsional angle $C1-S1\cdots S1'-C1a = 37.8^{\circ}$), attributed to steric interactions between the tert-butyl groups. The allyl residues are all oriented away from the cavity. There are no specific intermolecular interactions in 8. The C-S bonds are of length 1.783(1) Å (S1-C1, S1'-C1'). Virtually the same distances are seen in 3.

Fig. 3 displays the molecular structure of the hexanitrile 15. The macrobicycle adopts a folded conformation, which is similar but not identical to that seen in 8. Here, the two phenyl rings plane are bent into the cleft formed by the macrocycle, at an interplanar angle of 19°. The structure is stabilised by two intermolecular $CH \cdots \pi$ interactions as indicated by relatively short distances between the methylene groups and the aromatic rings (C11···centroid(aromatic ring) = 3.823 Å).41 In contrast to the hexaallylated macrocycle, molecules of 15 are connected via intermolecular $CH_2 \cdots NC$ interactions $(N4 \cdots H17b'' = 3.013,$ N5···H25b" 2.517, N6···H19b" 2.735 Å). These interactions lead to a three-dimensional network. The structure of the tetramethoxyethylated aza-thioether 20 is very similar to that of 15 (when neglecting the different N-substituents). However, the tilting of the two aryl rings is not so pronounced (5°) and the C11···centroid distances are longer at 3.875 Å.

Hexa(2-methoxyacetylated) macrobicycle 17 crystallizes from DMSO with three solvate molecules. Fig. 4 shows the structure of the macrobicycle, which forms an inclusion complex with a DMSO molecule. The guest molecule is held in place by a $CH \cdots \pi$ interaction of length 3.823 Å (C11 \cdots centroid(aromatic ring)). The other two DMSO molecules are enclathrated in the voids of the structure. The structure of 17-3DMSO should be compared with that of the tetra(2-methoxyacetylated) derivative 19.2DMSO.2H₂O (Fig. 4, right). This compound crystallizes also

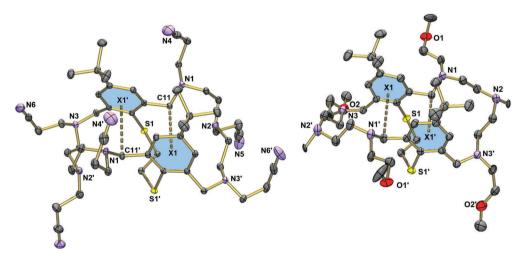

Fig. 3 Left: Molecular structure of 15 in the crystal with atomic numbering for key atoms and centroids of aromatic rings. Thermal ellipsoids are set at 30% probability. Symmetry code used to generate equivalent atoms: 1/2 - x, y, 1 - z. Right: Molecular structure of **20** in the crystal. Hydrogen atoms have been omitted for clarity. Symmetry code: -x, y, 1/2-z. NJC Paper

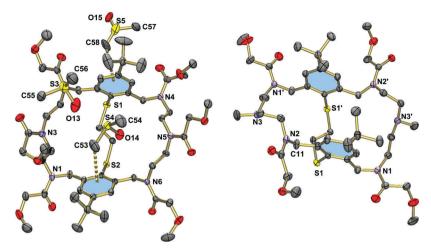

Fig. 4 Left: Molecular structure of 17·3DMSO in the crystal. The atom N3 is obscured by a DMSO molecule (O(13)S(3)C(56)C(57)). The DMSO molecule O(15)S(5)C(58)C(59) is disordered over two positions. Only one orientation is displayed. Right: Molecular structure of 19.2DMSO.2H₂O in the crystal. Thermal ellipsoids are set at 50% probability. Hydrogen atoms have been omitted for clarity.

with solvate molecules, but does not form an inclusion complex. The two phenyl rings in 19 are coplanar as in the hexanitrile 15. However, the distance between the two best planes through the benzene rings is much larger at 5.087 Å. As a consequence, the phenyl rings are not involved in intermolecular $CH \cdot \cdot \cdot \pi$ interactions with the adjacent benzyl group (C11···centroid(aromatic ring) = 4.802 Å). Clearly, removal of two methoxyacetyl residues exerts more conformational flexibility on the macrocycle.

Fig. 5 displays the structure of the protected macrobicycle 23, which has crystallographically imposed inversion symmetry. Unlike in the above structures, the thioether adopts a stepped conformation, presumably a consequence of the steric requirements of the N-carbamate groups. As a consequence, the macrocycles are engaged in intermolecular $CH \cdot \cdot \cdot \pi$ interactions. The corresponding $CH \cdots \pi$ distances at 3.428 Å (C11···centroid(aromatic ring)) are significantly shorter than in 15 or 20. This compound crystallizes without guest molecules.

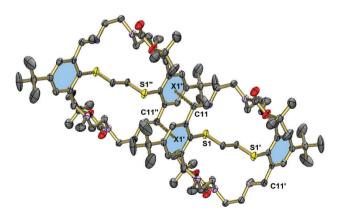

Fig. 5 Molecular structure of compound 23 in the crystal showing the intermolecular $CH\cdots\pi$ interactions. Hydrogen atoms are omitted for clarity. Selected bond lengths [Å]: C1-S1 1.789(3) Å. Symmetry codes: -x, 1-y, -z ('); -x, 2-y, -z (").

Conclusion

Overall, a short and efficient protocol for the functionalization of bicyclic aza-thioethers has been described. All six secondary amine functions of the parent macrobicycles 1 and 2 are readily alkylated without overalkylation and without affecting the masked thiolate functions. The protocol is also feasible for the synthesis of macrobicycles with different alkyl groups on the benzylic and central nitrogen atoms of the linking diethylene triamine units, such that these derivatives are also now available. Six of the twelve new compounds were obtained in crystalline form, such that their molecular structures could be determined. In the solid state the macrobicycles can adopt a stepped or a folded conformation. The structures appear to be primarily governed by inter- and intramolecular $CH_2\cdots\pi$ interactions (involving the benzylic methylene groups and the aromatic rings) rather due to steric effects played by the N alkyl functions. The observation that DMSO, which is a good CH donor, can form an inclusion complex held in place by a $CH_3 \cdots \pi$ interaction would be consistent with this in view.
